Dplyr-like API for tech.ml.dataset

GenerateMe

2020-11-08

tech-ml-version

"5.00-alpha-24"

Introduction

tech.ml.dataset is a great and fast library which brings columnar dataset to the Clojure. Chris Nuernberger has been working on this library for last year as a part of bigger tech.ml stack.

I've started to test the library and help to fix uncovered bugs. My main goal was to compare functionalities with the other standards from other platforms. I focused on R solutions: dplyr, tidyr and data.table.

During conversions of the examples I've come up how to reorganized existing tech.ml.dataset functions into simple to use API. The main goals were:

- Focus on dataset manipulation functionality, leaving other parts of tech.ml like pipelines, datatypes, readers, ML, etc.
- Single entry point for common operations one function dispatching on given arguments.
- group-by results with special kind of dataset a dataset containing subsets created after grouping as a column.
- Most operations recognize regular dataset and grouped dataset and process data accordingly.
- One function form to enable thread-first on dataset.

If you want to know more about tech.ml.dataset and tech.ml.datatype please refer their documentation:

- Datatype
- Date/time
- Dataset

SOURCE CODE

Join the discussion on Zulip

Let's require main namespace and define dataset used in most examples:

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 3 | 1.5 | С |
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 7 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |

Functionality

Dataset

Dataset is a special type which can be considered as a map of columns implemented around tech.ml.datatype library. Each column can be considered as named sequence of typed data. Supported types include integers, floats, string, boolean, date/time, objects etc.

Dataset creation

Dataset can be created from various of types of Clojure structures and files:

- single values
- sequence of maps
- map of sequences or values
- sequence of columns (taken from other dataset or created manually)
- sequence of pairs
- file types: raw/gzipped csv/tsv, json, xls(x) taken from local file system or URL
- input stream

api/dataset accepts:

- data
- options (see documentation of tech.ml.dataset/->dataset function for full list):
 - :dataset-name name of the dataset
 - :num-rows number of rows to read from file
 - :header-row? indication if first row in file is a header
 - :key-fn function applied to column names (eg. keyword, to convert column names to keywords)
 - :separator column separator
 - :single-value-column-name name of the column when single value is provided

| Empty dataset. | | |
|----------------------------|--|--|
| (api/dataset) | | |
| _unnamed [0 0] | | |
| Dataset from single value. | | |
| (api/dataset 999) | | |
| _unnamed [1 1]: | | |

 $\frac{:\$ value}{999}$

Set column name for single value. Also set the dataset name.

 $\underline{\quad}$ unnamed [1 1]:

 $\frac{\text{my-single-value}}{999}$

Single value [1 1]:

 $\frac{0}{999}$

Sequence of pairs (first = column name, second = value(s)).

```
(api/dataset [[:A 33] [:B 5] [:C :a]])
```

_unnamed [1 3]:

:A :B :C 33 5 :a

Not sequential values are repeated row-count number of times.

```
(api/dataset [[:A [1 2 3 4 5 6]] [:B "X"] [:C :a]])
```

 $\underline{\quad}$ unnamed [6 3]:

| :A | :В | :(|
|----|----|----|
| 1 | X | :a |
| 2 | X | :a |
| 3 | X | :a |
| 4 | X | :a |
| 5 | X | :a |
| 6 | X | :a |
| | | |

Dataset created from map (keys = column names, vals = value(s)). Works the same as sequence of pairs.

```
(api/dataset {:A 33})
(api/dataset {:A [1 2 3]})
(api/dataset {:A [3 4 5] :B "X"})
_unnamed [1 1]:
                                                           :A
                                                           33
_unnamed [3 1]:
                                                           <u>:A</u>
                                                           1
                                                           2 3
\underline{\phantom{a}}unnamed [3 2]:
                                                        :A
                                                             :В
                                                        3
                                                              Χ
                                                        4
                                                              \mathbf{X}
                                                              \mathbf{X}
You can put any value inside a column
(api/dataset {:A [[3 4 5] [:a :b]] :B "X"})
\underline{\quad} unnamed [2 2]:
                                                      :A
                                                                :В
                                                                X
                                                      [3\ 4\ 5]
                                                      [:a :b]
                                                                \mathbf{X}
Sequence of maps
(api/dataset [{:a 1 :b 3} {:b 2 :a 99}])
(api/dataset [{:a 1 :b [1 2 3]} {:a 2 :b [3 4]}])
\underline{\phantom{a}}unnamed [2 2]:
                                                              :b
                                                              3
                                                        99
\underline{\phantom{a}}unnamed [2 2]:

Saving

Export dataset to a file or output stream can be done by calling api/write!. Function accepts:

- dataset
- file name with one of the extensions: .csv, .tsv, .csv.gz and .tsv.gz or output stream
- options:
 - :separator string or separator char.

```
(api/write! ds "output.tsv.gz")
(.exists (clojure.java.io/file "output.tsv.gz"))
```

nil true

Nippy

```
(api/write-nippy! DS "output.nippy.gz")
```

nil

```
(api/read-nippy "output.nippy.gz")
```

Getting a dataset name

(api/dataset-name ds)

"https://vega.github.io/vega-lite/examples/data/seattle-weather.csv"

Setting a dataset name (operation is immutable).

Columns and rows

Get columns and rows as sequences. column, columns and rows treat grouped dataset as regular one. See Groups to read more about grouped datasets.

Select column.

```
(ds "wind")
(api/column ds "date")
```

#tech.v3.dataset.column<float64>[1461]

wind

[4.700, 4.500, 2.300, 4.700, 6.100, 2.200, 2.300, 2.000, 3.400, 3.400, 5.100, 1.900, 1.300, 5.300, 3.20 #tech.v3.dataset.column<packed-local-date>[1461]

date

 $[2012-01-01,\ 2012-01-02,\ 2012-01-03,\ 2012-01-04,\ 2012-01-05,\ 2012-01-06,\ 2012-01-07,\ 2012-01-08,\ 20$

Columns as sequence

```
(take 2 (api/columns ds))
```

(#tech.v3.dataset.column<packed-local-date>[1461]

                                 8 \| 1.0 \|
                                                  B \ | |
```

```
(api/print-dataset (api/group-by DS :V1) {:print-line-policy :single})
```

_unnamed [2 3]:

Group-by

Grouping by is an operation which splits dataset into subdatasets and pack it into new special type of... dataset. I distinguish two types of dataset: regular dataset and grouped dataset. The latter is the result of grouping.

Grouped dataset is annotated in by :grouped? meta tag and consist following columns:

- :name group name or structure
- :group-id integer assigned to the group
- :data groups as datasets

Almost all functions recognize type of the dataset (grouped or not) and operate accordingly.

You can't apply reshaping or join/concat functions on grouped datasets.

Grouping

Grouping is done by calling group-by function with arguments:

- ds dataset
- grouping-selector what to use for grouping
- options:
 - :result-type what to return:
 - * :as-dataset (default) return grouped dataset
 - * :as-indexes return rows ids (row number from original dataset)
 - * :as-map return map with group names as keys and subdataset as values
 - * :as-seq return sequens of subdatasets
- :select-keys list of the columns passed to a grouping selector function

All subdatasets (groups) have set name as the group name, additionally group-id is in meta.

Grouping can be done by:

- single column name
- seg of column names
- map of keys (group names) and row indexes
- value returned by function taking row as map (limited to :select-keys)

Note: currently dataset inside dataset is printed recursively so it renders poorly from markdown. So I will use :as-seq result type to show just group names and groups.

```
List of columns in grouped dataset
(-> DS
    (api/group-by :V1)
    (api/column-names))
(:V1 :V2 :V3 :V4)
List of columns in grouped dataset treated as regular dataset
(-> DS
    (api/group-by :V1)
    (api/as-regular-dataset)
    (api/column-names))
(:name :group-id :data)
Content of the grouped dataset
(api/columns (api/group-by DS :V1) :as-map)
{:name #tech.v3.dataset.column<int64>[2]
:name
[1, 2, ], :group-id #tech.v3.dataset.column<int64>[2]
:group-id
[0, 1, ], :data #tech.v3.dataset.column<dataset>[2]
:data
[Group: 1 [5 4]:

| 2 | 4 | 0.5 | A |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 8 | 1.0 | В |

)

Group dataset as map of indexes (row ids)

```
(api/group-by DS :V1 {:result-type :as-indexes})
```

```
{1 #list<int32>[5]
[0, 2, 4, 6, 8, ], 2 #list<int32>[4]
[1, 3, 5, 7, ]}
```

Grouped datasets are printed as follows by default.

```
(api/group-by DS :V1)
```

 $\underline{}$ unnamed [2 3]:

| :name | :group-id | :data |
|-------|-----------|-----------------|
| 1 | 0 | Group: 1 [5 4]: |
| 2 | 1 | Group: 2 [4 4]: |

To get groups as sequence or a map can be done from grouped dataset using <code>groups->seq</code> and <code>groups->map</code> functions.

Groups as seq can be obtained by just accessing :data column.

I will use temporary dataset here.

```
(let [ds (-> {"a" [1 1 2 2]
               "b" ["a" "b" "c" "d"]}
              (api/dataset)
              (api/group-by "a"))]
  (seq (ds :data))) ;; seq is not necessary but Markdown treats `:data` as command here
(Group: 1 [2 2]:
                                            a b
                                            1 a
                                            1 b
Group: 2 [2 2]:
                                            a b
                                            2 c
                                            2 d
(-> {"a" [1 1 2 2]
     "b" ["a" "b" "c" "d"]}
    (api/dataset)
    (api/group-by "a")
    (api/groups->seq))
(Group: 1 [2 2]:
                                               b
                                            1
                                              \mathbf{a}
                                            1 b
Group: 2 [2 2]:
                                               b
                                            2 c
                                            2 d
)
Groups as map
(-> {"a" [1 1 2 2]
     "b" ["a" "b" "c" "d"]}
    (api/dataset)
    (api/group-by "a")
    (api/groups->map))
```

{1 Group: 1 [2 2]:

a b
1 a
1 b

, 2 Group: 2 [2 2]:

 $\begin{array}{cc} a & b \\ \hline 2 & c \\ 2 & d \end{array}$

}

Grouping by more than one column. You can see that group names are maps. When ungrouping is done these maps are used to restore column names.

(api/group-by DS [:V1 :V3] {:result-type :as-seq})

(Group: {:V3 1.0, :V1 1} [1 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 5 | 1.0 | В |

Group: {:V3 0.5, :V1 1} [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 1 | 7 | 0.5 | A |

Group: {:V3 0.5, :V1 2} [1 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 2 | 4 | 0.5 | A |

Group: {:V3 1.0, :V1 2} [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 2 | 2 | 1.0 | В |
| 2 | 8 | 1.0 | В |

Group: {:V3 1.5, :V1 1} [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 3 | 1.5 | С |
| 1 | 9 | 1.5 | \mathbf{C} |

Group: {:V3 1.5, :V1 2} [1 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 2 | 6 | 1.5 | С |

)

Grouping can be done by providing just row indexes. This way you can assign the same row to more than one group.

(Group: group-a [4 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----------------|
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | $^{\mathrm{C}}$ |
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |

Group: group-b [4 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 6 | 1.5 | С |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 2 | 1.0 | В |
| | | | |

)

You can group by a result of grouping function which gets row as map and should return group name. When map is used as a group name, ungrouping restore original column names.

(Group: 1.0 [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |

Group: 2.0 [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 2 | 2 | 1.0 | В |
| 2 | 8 | 1.0 | В |

Group: 0.5 [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 1 | 7 | 0.5 | A |

Group: 3.0 [1 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----------------|
| 2 | 6 | 1.5 | $^{\mathrm{C}}$ |

Group: 1.5 [2 4]:

| :V1 | :V2 | :V2 :V3 | |
|-----|-----|---------|--------------|
| 1 | 3 | 1.5 | С |
| 1 | 9 | 1.5 | \mathbf{C} |

)

You can use any predicate on column to split dataset into two groups.

```
(api/group-by DS (comp #(< % 1.0) :V3) {:result-type :as-seq})</pre>
```

(Group: false [6 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |

Group: true [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 4 | 0.5 | A |
| 1 | 7 | 0.5 | A |

```
)
juxt is also helpful
(api/group-by DS (juxt :V1 :V3) {:result-type :as-seq})
(Group: [1 1.0] [1 4]:
                                             :V1

)

Ungrouping

Ungrouping simply concats all the groups into the dataset. Following options are possible

- :order? order groups according to the group name ascending order. Default: false
- :add-group-as-column should group name become a column? If yes column is created with provided name (or :\$group-name if argument is true). Default: nil.
- :add-group-id-as-column should group id become a column? If yes column is created with provided name (or :\$group-id if argument is true). Default: nil.
- :dataset-name to name resulting dataset. Default: nil (unnamed)

If group name is a map, it will be splitted into separate columns. Be sure that groups (subdatasets) doesn't contain the same columns already.

If group name is a vector, it will be splitted into separate columns. If you want to name them, set vector of target column names as :add-group-as-column argument.

After ungrouping, order of the rows is kept within the groups but groups are ordered according to the internal storage.

Grouping and ungrouping.

```
(-> DS
    (api/group-by :V3)
    (api/ungroup))
```

_unnamed [9 4]:

| 2 | 4 | 0.5 | A |
| 1 | 7 | 0.5 | A |

Let's add group name and id as additional columns

_unnamed [9 6]:

| $\overline{:group-name :group-id}$ | :V1 | :V2 | :V3 | :V4 | |
|------------------------------------|-----|-----|-----|-----|--------------|
| false | 0 | 2 | 4 | 0.5 | A |
| false | 0 | 1 | 5 | 1.0 | В |
| false | 0 | 2 | 6 | 1.5 | \mathbf{C} |
| false | 0 | 1 | 7 | 0.5 | A |
| false | 0 | 2 | 8 | 1.0 | В |
| false | 0 | 1 | 9 | 1.5 | \mathbf{C} |
| true | 1 | 1 | 1 | 0.5 | A |
| true | 1 | 2 | 2 | 1.0 | В |
| true | 1 | 1 | 3 | 1.5 | \mathbf{C} |
| | | | | | |

Let's assign different column names

_unnamed [9 6]:

| Is V2 less than 4? | group id | :V1 | :V2 | :V3 | :V4 |
|--------------------|----------|-----|------|-----|--------------|
| false | 0 | 2 | 4 | 0.5 | A |
| false | 0 | 1 | 5 | 1.0 | В |
| false | 0 | 2 | 6 | 1.5 | \mathbf{C} |
| false | 0 | 1 | 7 | 0.5 | A |
| false | 0 | 2 | 8 | 1.0 | В |
| false | 0 | 1 | 9 | 1.5 | \mathbf{C} |
| true | 1 | 1 | 1 | 0.5 | A |
| true | 1 | 2 | 2 | 1.0 | В |
| true | 1 | 1 | 3 | 1.5 | С |

If we group by map, we can automatically create new columns out of group names.

_unnamed [9 6]:

| V1 and V3 multiplied | V4 as lowercase | :V1 | :V2 | :V3 | :V4 |
|----------------------|-----------------|-----|-----|-----|--------------|
| 1.0 | a | 2 | 4 | 0.5 | A |
| 0.5 | a | 1 | 1 | 0.5 | A |
| 0.5 | a | 1 | 7 | 0.5 | A |
| 1.0 | b | 1 | 5 | 1.0 | В |
| 2.0 | b | 2 | 2 | 1.0 | В |
| 2.0 | b | 2 | 8 | 1.0 | В |
| 3.0 | c | 2 | 6 | 1.5 | \mathbf{C} |
| 1.5 | c | 1 | 3 | 1.5 | \mathbf{C} |
| 1.5 | c | 1 | 9 | 1.5 | \mathbf{C} |

We can add group names without separation

_unnamed [9 5]:

| just map | :V1 | :V2 | :V3 | :V4 |
|---|-----|-----|-----|--------------|
| {"V1 and V3 multiplied" 1.0, "V4 as lowercase" "a"} | 2 | 4 | 0.5 | A |
| {"V1 and V3 multiplied" 0.5, "V4 as lowercase" "a"} | 1 | 1 | 0.5 | A |
| {"V1 and V3 multiplied" 0.5, "V4 as lowercase" "a"} | 1 | 7 | 0.5 | A |
| {"V1 and V3 multiplied" 1.0, "V4 as lowercase" "b"} | 1 | 5 | 1.0 | В |
| {"V1 and V3 multiplied" 2.0, "V4 as lowercase" "b"} | 2 | 2 | 1.0 | В |
| {"V1 and V3 multiplied" 2.0, "V4 as lowercase" "b"} | 2 | 8 | 1.0 | В |
| {"V1 and V3 multiplied" 3.0, "V4 as lowercase" "c"} | 2 | 6 | 1.5 | \mathbf{C} |
| {"V1 and V3 multiplied" 1.5, "V4 as lowercase" "c"} | 1 | 3 | 1.5 | \mathbf{C} |
| {"V1 and V3 multiplied" 1.5, "V4 as lowercase" "c"} | 1 | 9 | 1.5 | \mathbf{C} |

The same applies to group names as sequences

```
(-> DS
    (api/group-by (juxt :V1 :V3))
    (api/ungroup {:add-group-as-column "abc"}))
```

_unnamed [9 6]:

| :abc-0 | :abc-1 | :V1 | :V2 | :V3 | :V4 |
|--------|--------|-----|-----|-----|--------------|
| 1 | 1.0 | 1 | 5 | 1.0 | В |
| 1 | 0.5 | 1 | 1 | 0.5 | A |
| 1 | 0.5 | 1 | 7 | 0.5 | A |
| 2 | 1.5 | 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 1.5 | 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 1.5 | 1 | 9 | 1.5 | \mathbf{C} |
| 2 | 0.5 | 2 | 4 | 0.5 | A |
| 2 | 1.0 | 2 | 2 | 1.0 | В |

| :abc-0 | :abc-1 | :V1 | :V2 | :V3 | :V4 |
|--------|--------|-----|-----|-----|-----|
| 2 | 1.0 | 2 | 8 | 1.0 | В |

Let's provide column names

```
(-> DS
    (api/group-by (juxt :V1 :V3))
    (api/ungroup {:add-group-as-column ["v1" "v3"]}))
```

_unnamed [9 6]:

| $\overline{v1}$ | v3 | :V1 | :V2 | :V3 | :V4 |
|-----------------|-----|-----|-----|-----|--------------|
| 1 | 1.0 | 1 | 5 | 1.0 | В |
| 1 | 0.5 | 1 | 1 | 0.5 | A |
| 1 | 0.5 | 1 | 7 | 0.5 | A |
| 2 | 1.5 | 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 1.5 | 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 1.5 | 1 | 9 | 1.5 | \mathbf{C} |
| 2 | 0.5 | 2 | 4 | 0.5 | A |
| 2 | 1.0 | 2 | 2 | 1.0 | В |
| 2 | 1.0 | 2 | 8 | 1.0 | В |
| | | | | | |

Also we can supress separation

 $\underline{}$ unnamed [9 5]:

| :\$group-name | :V1 | :V2 | :V3 | :V4 |
|---------------|-----|-----|-----|--------------|
| [1 1.0] | 1 | 5 | 1.0 | В |
| $[1 \ 0.5]$ | 1 | 1 | 0.5 | A |
| $[1 \ 0.5]$ | 1 | 7 | 0.5 | A |
| $[2\ 1.5]$ | 2 | 6 | 1.5 | \mathbf{C} |
| $[1 \ 1.5]$ | 1 | 3 | 1.5 | \mathbf{C} |
| $[1 \ 1.5]$ | 1 | 9 | 1.5 | \mathbf{C} |
| $[2\ 0.5]$ | 2 | 4 | 0.5 | A |
| $[2\ 1.0]$ | 2 | 2 | 1.0 | В |
| $[2\ 1.0]$ | 2 | 8 | 1.0 | В |

Other functions

To check if dataset is grouped or not just use grouped? function.

```
(api/grouped? DS)
```

nil

```
(api/grouped? (api/group-by DS :V1))
true
```

If you want to remove grouping annotation (to make all the functions work as with regular dataset) you can use unmark-group or as-regular-dataset (alias) functions.

It can be important when you want to remove some groups (rows) from grouped dataset using drop-rows or something like that.

```
(-> DS
    (api/group-by :V1)
    (api/as-regular-dataset)
    (api/grouped?))
```

nil

This is considered internal.

If you want to implement your own mapping function on grouped dataset you can call process-group-data and pass function operating on datasets. Result should be a dataset to have ungrouping working.

```
(-> DS
     (api/group-by :V1)
     (api/process-group-data #(str "Shape: " (vector (api/row-count %) (api/column-count %))))
     (api/as-regular-dataset))
```

unnamed $[2\ 3]$:

| :name | :group-id | :data |
|-------|-----------|--------------|
| 1 | 0 | Shape: [5 4] |
| 2 | 1 | Shape: [4 4] |

Columns

Column is a special tech.ml.dataset structure based on tech.ml.datatype library. For our purposes we cat treat columns as typed and named sequence bound to particular dataset.

Type of the data is inferred from a sequence during column creation.

Names

To select dataset columns or column names columns-selector is used. columns-selector can be one of the following:

- :all keyword selects all columns
- column name for single column
- sequence of column names for collection of columns
- regex to apply pattern on column names or datatype
- filter predicate to filter column names or datatype
- type namespaced keyword for specific datatype or group of datatypes

Column name can be anything.

column-names function returns names according to columns-selector and optional meta-field. meta-field is one of the following:

- :name (default) to operate on column names
- :datatype to operated on column types
- :all if you want to process all metadata

Datatype groups are:

- :type/numerical any numerical type
- :type/float floating point number (:float32 and :float64)
- :type/integer any integer
- :type/datetime any datetime type

If qualified keyword starts with :!type, complement set is used.

To select all column names you can use column-names function.

```
(api/column-names DS)

(:V1 :V2 :V3 :V4)

or

(api/column-names DS :all)

(:V1 :V2 :V3 :V4)
```

In case you want to select column which has name :all (or is sequence or map), put it into a vector. Below code returns empty sequence since there is no such column in the dataset.

```
(api/column-names DS [:all])
```

()

Obviously selecting single name returns it's name if available

```
(api/column-names DS :V1)
(api/column-names DS "no such column")
(:V1)
```

(:V1_.

Select sequence of column names.

```
(api/column-names DS [:V1 "V2" :V3 :V4 :V5])
(:V1 :V3 :V4)
```

Select names based on regex, columns ends with 1 or 4

```
(api/column-names DS #".*[14]")
```

```
(:V1 :V4)
```

Select names based on regex operating on type of the column (to check what are the column types, call (api/info DS :columns). Here we want to get integer columns only.

```
(api/column-names DS #"^:int.*" :datatype)
(:V1 :V2)
(api/column-names DS :type/integer)
(:V1 :V2)
And finally we can use predicate to select names. Let's select double precision columns.
(api/column-names DS #{:float64} :datatype)
(:V3)
or
(api/column-names DS :type/float64)
(:V3)
If you want to select all columns but given, use complement function. Works only on a predicate.
(api/column-names DS (complement #{:V1}))
(api/column-names DS (complement #{:float64}) :datatype)
(api/column-names DS :!type/float64)
(:V2:V3:V4)
(:V1 :V2 :V4)
(:V1 :V2 :V4)
You can select column names based on all column metadata at once by using :all metadata selector. Below
```

we want to select column names ending with 1 which have long datatype.

```
(api/column-names DS (fn [meta]
                       (and (= :int64 (:datatype meta))
                            (clojure.string/ends-with? (:name meta) "1"))) :all)
(:V1)
```

Select

select-columns creates dataset with columns selected by columns-selector as described above. Function works on regular and grouped dataset.

```
Select only float64 columns
```

```
(api/select-columns DS #(= :float64 %) :datatype)
```

_unnamed [9 1]:

:V3 0.5

1.0

:V3 1.5 0.5 1.0 1.5 0.5 1.0 1.5

or

```
(api/select-columns DS :type/float64)
```

_unnamed [9 1]:

:V3 0.5 1.0 1.5 0.5 1.0 1.5 0.5 1.0 1.5

Select all but :V1 columns

```
(api/select-columns DS (complement #{:V1}))
```

_unnamed [9 3]:

| :V2 | :V3 | :V4 |
|-----|-----|-----------------|
| 1 | 0.5 | A |
| 2 | 1.0 | В |
| 3 | 1.5 | \mathbf{C} |
| 4 | 0.5 | A |
| 5 | 1.0 | В |
| 6 | 1.5 | \mathbf{C} |
| 7 | 0.5 | A |
| 8 | 1.0 | В |
| 9 | 1.5 | $^{\mathrm{C}}$ |
| | | |

If we have grouped data set, column selection is applied to every group separately.

```
(-> DS
     (api/group-by :V1)
     (api/select-columns [:V2 :V3])
     (api/groups->map))
```

{1 Group: 1 [5 2]:

| :V2 :V3 | 3 |
|---------|---|
| 1 0.5 | |
| 3 1.5 | |
| 5 1.0 | |
| 7 	 0.5 | |
| 9 1.5 | |

, 2 Group: 2 [4 2]:

| :V2 | :V3 |
|-----|-----|
| 2 | 1.0 |
| 4 | 0.5 |
| 6 | 1.5 |
| 8 | 1.0 |

}

Drop

 ${\tt drop-columns}\ {\tt creates}\ {\tt dataset}\ {\tt with}\ {\tt removed}\ {\tt columns}.$

Drop float
64 columns

```
(api/drop-columns DS #(= :float64 %) :datatype)
```

_unnamed [9 3]:

| :V1 | :V2 | :V4 |
|-----|-----|--------------|
| 1 | 1 | A |
| 2 | 2 | В |
| 1 | 3 | \mathbf{C} |
| 2 | 4 | A |
| 1 | 5 | В |
| 2 | 6 | \mathbf{C} |
| 1 | 7 | A |
| 2 | 8 | В |
| 1 | 9 | \mathbf{C} |

or

(api/drop-columns DS :type/float64)

 $\underline{}$ unnamed [9 3]:

| :V1 | :V2 | :V4 |
|-----|-----|--------------|
| 1 | 1 | A |
| 2 | 2 | В |
| 1 | 3 | \mathbf{C} |

| :V1 | :V2 | :V4 |
|-----|-----|--------------|
| 2 | 4 | A |
| 1 | 5 | В |
| 2 | 6 | \mathbf{C} |
| 1 | 7 | A |
| 2 | 8 | В |
| 1 | 9 | \mathbf{C} |

Drop all columns but :V1 and :V2

```
(api/drop-columns DS (complement #{:V1 :V2}))
```

_unnamed [9 2]:

| :V1 | :V2 |
|-----|--------|
| 1 | 1 |
| 2 | 2 |
| 1 | 3 |
| 2 | 4 |
| 1 | 5 |
| 2 | 6 |
| 1 | 7 |
| 2 | 8 9 |
| 1 | 9 |
| | |

If we have grouped data set, column selection is applied to every group separately. Selected columns are dropped.

```
(-> DS
    (api/group-by :V1)
    (api/drop-columns [:V2 :V3])
    (api/groups->map))
```

{1 Group: 1 [5 2]:

| :V1 | :V4 |
|-----|--------------|
| 1 | A |
| 1 | \mathbf{C} |
| 1 | В |
| 1 | A |
| 1 | С |

, 2 Group: 2 [4 2]:

$$\begin{array}{c|cc}
\hline
:V1 & :V4 \\
\hline
2 & B \\
2 & A \\
2 & C
\end{array}$$

```
\frac{\text{:V1} \quad \text{:V4}}{2}
```

}

Rename

If you want to rename colums use rename-columns and pass map where keys are old names, values new ones.

You can also pass mapping function with optional columns-selector

_unnamed [9 4]:

| v1 | v2 | [1 2 3] | java.lang.Object@4b42e37c |
|----|----|---------|---------------------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 7 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | C |

Map all names with function

```
(api/rename-columns DS (comp str second name))
```

 $\underline{\text{unnamed } [9 \ 4]}$:

```
1
    1
        0.5
               A
2
    2
         1.0
               В
1
    3
               \mathbf{C}
         1.5
2
    4
         0.5
               A
1
    5
         1.0
               В
2
               \mathbf{C}
         1.5
1
         0.5
               Α
2
    8
         1.0
               В
               С
    9
         1.5
```

Map selected names with function

```
(api/rename-columns DS [:V1 :V3] (comp str second name))
```

_unnamed [9 4]:

| 1 :V2 3 :V 1 1 0.5 A 2 2 1.0 B 1 3 1.5 C 2 4 0.5 A 1 5 1.0 B | | | | |
|--|---|-----|-----|--------------|
| $\begin{array}{cccccccccccccccccccccccccccccccccccc$ | 1 | :V2 | 3 | :V4 |
| 1 3 1.5 C 2 4 0.5 A | 1 | 1 | 0.5 | A |
| 2 4 0.5 A | 2 | 2 | 1.0 | В |
| | 1 | 3 | 1.5 | \mathbf{C} |
| 1 5 1.0 B | 2 | 4 | 0.5 | A |
| | 1 | 5 | 1.0 | В |
| 2 6 1.5 C | 2 | 6 | 1.5 | \mathbf{C} |
| 1 7 0.5 A | 1 | 7 | 0.5 | A |
| 2 8 1.0 B | 2 | 8 | 1.0 | В |
| 1 9 1.5 C | 1 | 9 | 1.5 | С |

Function works on grouped dataset

{1 Group: 1 [5 4]:

| v1 | v2 | $[1 \ 2 \ 3]$ | java.lang. Object@212f4dca |
|----|----|---------------|----------------------------|
| 1 | 1 | 0.5 | A |
| 1 | 3 | 1.5 | С |
| 1 | 5 | 1.0 | В |
| 1 | 7 | 0.5 | A |
| 1 | 9 | 1.5 | С |

, 2 Group: 2 [4 4]:

| v1 | v2 | $[1 \ 2 \ 3]$ | java.lang.Object@212f4dca |
|----|----|---------------|---------------------------|
| 2 | 2 | 1.0 | В |
| 2 | 4 | 0.5 | A |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 8 | 1.0 | В |

Add or update

}

To add (or replace existing) column call add-or-replace-column function. Function accepts:

- ds a dataset
- column-name if it's existing column name, column will be replaced
- column can be column (from other dataset), sequence, single value or function. Too big columns are always trimmed. Too small are cycled or extended with missing values (according to size-strategy

argument)

- size-strategy (optional) when new column is shorter than dataset row count, following strategies are applied:
- :cycle (default) repeat data
 - :na append missing values
 - :strict throws an exception when sizes mismatch

Function works on grouped dataset.

Add single value as column

```
(api/add-or-replace-column DS :V5 "X")
```

_unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :V5 |
|-----|-----|-----|--------------|-----|
| 1 | 1 | 0.5 | A | X |
| 2 | 2 | 1.0 | В | X |
| 1 | 3 | 1.5 | \mathbf{C} | X |
| 2 | 4 | 0.5 | \mathbf{A} | X |
| 1 | 5 | 1.0 | В | X |
| 2 | 6 | 1.5 | \mathbf{C} | X |
| 1 | 7 | 0.5 | A | X |
| 2 | 8 | 1.0 | В | X |
| 1 | 9 | 1.5 | С | X |

Replace one column (column is trimmed)

```
(api/add-or-replace-column DS :V1 (repeatedly rand))
```

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|----------|-----|-----|--------------|
| 0.6700 | 1 | 0.5 | A |
| 0.03586 | 2 | 1.0 | В |
| 0.4679 | 3 | 1.5 | \mathbf{C} |
| 0.5257 | 4 | 0.5 | A |
| 0.8614 | 5 | 1.0 | В |
| 0.7463 | 6 | 1.5 | \mathbf{C} |
| 0.001375 | 7 | 0.5 | A |
| 0.6701 | 8 | 1.0 | В |
| 0.7661 | 9 | 1.5 | С |

Copy column

```
(api/add-or-replace-column DS : V5 (DS : V1))
```

_unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :V5 |
|-----|-----|-----|--------------|-----|
| 1 | 1 | 0.5 | A | 1 |
| 2 | 2 | 1.0 | В | 2 |
| 1 | 3 | 1.5 | \mathbf{C} | 1 |
| 2 | 4 | 0.5 | \mathbf{A} | 2 |
| 1 | 5 | 1.0 | В | 1 |
| 2 | 6 | 1.5 | \mathbf{C} | 2 |
| 1 | 7 | 0.5 | \mathbf{A} | 1 |
| 2 | 8 | 1.0 | В | 2 |
| 1 | 9 | 1.5 | \mathbf{C} | 1 |

When function is used, argument is whole dataset and the result should be column, sequence or single value (api/add-or-replace-column DS :row-count api/row-count)

_unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :row-count |
|-----|-----|-----|--------------|------------|
| 1 | 1 | 0.5 | A | 9 |
| 2 | 2 | 1.0 | В | 9 |
| 1 | 3 | 1.5 | \mathbf{C} | 9 |
| 2 | 4 | 0.5 | A | 9 |
| 1 | 5 | 1.0 | В | 9 |
| 2 | 6 | 1.5 | \mathbf{C} | 9 |
| 1 | 7 | 0.5 | A | 9 |
| 2 | 8 | 1.0 | В | 9 |
| 1 | 9 | 1.5 | \mathbf{C} | 9 |

Above example run on grouped dataset, applies function on each group separately.

```
(-> DS
    (api/group-by :V1)
    (api/add-or-replace-column :row-count api/row-count)
    (api/ungroup))
```

_unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :row-count |
|-----|-----|-----|--------------|------------|
| 1 | 1 | 0.5 | A | 5 |
| 1 | 3 | 1.5 | С | 5 |
| 1 | 5 | 1.0 | В | 5 |
| 1 | 7 | 0.5 | A | 5 |
| 1 | 9 | 1.5 | \mathbf{C} | 5 |
| 2 | 2 | 1.0 | В | 4 |
| 2 | 4 | 0.5 | A | 4 |
| 2 | 6 | 1.5 | \mathbf{C} | 4 |
| 2 | 8 | 1.0 | В | 4 |

When column which is added is longer than row count in dataset, column is trimmed. When column is shorter, it's cycled or missing values are appended.

```
(api/add-or-replace-column DS :V5 [:r :b])
```

 $\underline{\text{unnamed } [9 5]}$:

| :V1 | :V2 | :V3 | :V4 | :V5 |
|-----|-----|-----|--------------|-----|
| 1 | 1 | 0.5 | A | :r |
| 2 | 2 | 1.0 | В | :b |
| 1 | 3 | 1.5 | \mathbf{C} | :r |
| 2 | 4 | 0.5 | A | :b |
| 1 | 5 | 1.0 | В | :r |
| 2 | 6 | 1.5 | \mathbf{C} | :b |
| 1 | 7 | 0.5 | A | :r |
| 2 | 8 | 1.0 | В | :b |
| 1 | 9 | 1.5 | \mathbf{C} | :r |

```
(api/add-or-replace-column DS :V5 [:r :b] :na)
```

_unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :V5 |
|-----|-----|-----|--------------|-----|
| 1 | 1 | 0.5 | A | :r |
| 2 | 2 | 1.0 | В | :b |
| 1 | 3 | 1.5 | С | |
| 2 | 4 | 0.5 | A | |
| 1 | 5 | 1.0 | В | |
| 2 | 6 | 1.5 | \mathbf{C} | |
| 1 | 7 | 0.5 | A | |
| 2 | 8 | 1.0 | В | |
| 1 | 9 | 1.5 | \mathbf{C} | |

Exception is thrown when :strict strategy is used and column size is not equal row count

```
(try
  (api/add-or-replace-column DS :V5 [:r :b] :strict)
  (catch Exception e (str "Exception caught: "(ex-message e))))
```

"Exception caught: Column size (2) should be exactly the same as dataset row count (9)"

Tha same applies for grouped dataset

```
(-> DS
    (api/group-by :V3)
    (api/add-or-replace-column :V5 [:r :b] :na)
    (api/ungroup))
```

 $\underline{}$ unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :V5 |
|-----|-----|-----|--------------|-----|
| 2 | 2 | 1.0 | В | :r |
| 1 | 5 | 1.0 | В | :b |
| 2 | 8 | 1.0 | В | |
| 1 | 1 | 0.5 | A | :r |
| 2 | 4 | 0.5 | A | :b |
| 1 | 7 | 0.5 | A | |
| 1 | 3 | 1.5 | \mathbf{C} | :r |
| 2 | 6 | 1.5 | \mathbf{C} | :b |
| 1 | 9 | 1.5 | С | |

Let's use other column to fill groups

```
(-> DS
    (api/group-by :V3)
    (api/add-or-replace-column :V5 (DS :V2))
    (api/ungroup))
```

$\underline{}$ unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :V5 |
|-----|-----|-----|--------------|-----|
| 2 | 2 | 1.0 | В | 1 |
| 1 | 5 | 1.0 | В | 2 |
| 2 | 8 | 1.0 | В | 3 |
| 1 | 1 | 0.5 | A | 1 |
| 2 | 4 | 0.5 | A | 2 |
| 1 | 7 | 0.5 | \mathbf{A} | 3 |
| 1 | 3 | 1.5 | \mathbf{C} | 1 |
| 2 | 6 | 1.5 | \mathbf{C} | 2 |
| 1 | 9 | 1.5 | \mathbf{C} | 3 |

In case you want to add or update several columns you can call add-or-replace-columns and provide map where keys are column names, vals are columns.

_unnamed [9 6]:

| :V1 | :V2 | :V3 | :V4 | :V5 | :V6 |
|-----|-----|-----|--------------|-----|-----|
| 2 | 1 | 0.5 | A | :A | 11 |
| 3 | 2 | 1.0 | В | :В | 11 |
| 2 | 3 | 1.5 | \mathbf{C} | :C | 11 |
| 3 | 4 | 0.5 | \mathbf{A} | :A | 11 |
| 2 | 5 | 1.0 | В | :В | 11 |
| 3 | 6 | 1.5 | \mathbf{C} | :C | 11 |
| 2 | 7 | 0.5 | A | :A | 11 |
| 3 | 8 | 1.0 | В | :В | 11 |
| 2 | 9 | 1.5 | \mathbf{C} | :C | 11 |

Update

If you want to modify specific column(s) you can call update-columns. Arguments:

- dataset
- one of:
 - columns-selector and function (or sequence of functions)
 - $-\,$ map where keys are column names and vals are function

Functions accept column and have to return column or sequence

Reverse of columns

```
(api/update-columns DS :all reverse)
```

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|--------|--------------|
| 1 | 9 | 1.500 | С |
| 2 | 8 | 1.000 | В |
| 1 | 7 | 0.5000 | A |
| 2 | 6 | 1.500 | \mathbf{C} |
| 1 | 5 | 1.000 | В |
| 2 | 4 | 0.5000 | A |
| 1 | 3 | 1.500 | \mathbf{C} |
| 2 | 2 | 1.000 | В |
| 1 | 1 | 0.5000 | A |

Apply dec/inc on numerical columns

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|---------|--------------|
| 0 | 2 | -0.5000 | A |
| 1 | 3 | 0.000 | В |
| 0 | 4 | 0.5000 | \mathbf{C} |
| 1 | 5 | -0.5000 | A |
| 0 | 6 | 0.000 | В |
| 1 | 7 | 0.5000 | \mathbf{C} |
| 0 | 8 | -0.5000 | A |
| 1 | 9 | 0.000 | В |
| 0 | 10 | 0.5000 | \mathbf{C} |

You can also assing function to a column by packing operations into the map.

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 3 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 1 | 5 | 1.5 | \mathbf{C} |
| 2 | 1 | 0.5 | A |
| 1 | 9 | 1.0 | В |
| 2 | 2 | 1.5 | \mathbf{C} |
| 1 | 6 | 0.5 | A |
| 2 | 7 | 1.0 | В |
| 1 | 4 | 1.5 | \mathbf{C} |
| | | | |

Map

The other way of creating or updating column is to map rows as regular map function. The arity of mapping function should be the same as number of selected columns.

Arguments:

- ds dataset
- column-name target column name
- columns-selector columns selected
- map-fn mapping function

Let's add numerical columns together

_unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :sum-of-numbers |
|-----|-----|-----|--------------|-----------------|
| 1 | 1 | 0.5 | A | 2.5 |
| 2 | 2 | 1.0 | В | 5.0 |
| 1 | 3 | 1.5 | С | 5.5 |
| 2 | 4 | 0.5 | A | 6.5 |
| 1 | 5 | 1.0 | В | 7.0 |
| 2 | 6 | 1.5 | \mathbf{C} | 9.5 |
| 1 | 7 | 0.5 | A | 8.5 |
| 2 | 8 | 1.0 | В | 11.0 |
| 1 | 9 | 1.5 | \mathbf{C} | 11.5 |

The same works on grouped dataset

 $\underline{}$ unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :sum-of-numbers |
|-----|-----|-----|--------------|-----------------|
| 1 | 1 | 0.5 | A | 2.5 |
| 2 | 4 | 0.5 | A | 6.5 |
| 1 | 7 | 0.5 | A | 8.5 |
| 2 | 2 | 1.0 | В | 5.0 |
| 1 | 5 | 1.0 | В | 7.0 |
| 2 | 8 | 1.0 | В | 11.0 |
| 1 | 3 | 1.5 | \mathbf{C} | 5.5 |
| 2 | 6 | 1.5 | \mathbf{C} | 9.5 |
| 1 | 9 | 1.5 | \mathbf{C} | 11.5 |

Reorder

To reorder columns use columns selectors to choose what columns go first. The unseleted columns are appended to the end.

```
(api/reorder-columns DS :V4 [:V3 :V2])
```

 $\underline{\text{unnamed } [9 \ 4]}$:

| :V4 | :V2 | :V3 | :V1 |
|--------------|-----|-----|-----|
| A | 1 | 0.5 | 1 |
| В | 2 | 1.0 | 2 |
| \mathbf{C} | 3 | 1.5 | 1 |
| A | 4 | 0.5 | 2 |
| В | 5 | 1.0 | 1 |
| \mathbf{C} | 6 | 1.5 | 2 |
| A | 7 | 0.5 | 1 |
| В | 8 | 1.0 | 2 |
| С | 9 | 1.5 | 1 |

This function doesn't let you select meta field, so you have to call column-names in such case. Below we want to add integer columns at the end.

```
(api/reorder-columns DS (api/column-names DS (complement #{:int64}) :datatype))
```

_unnamed [9 4]:

| :V3 | :V4 | :V1 | :V2 |
|-----|--------------|-----|-----|
| 0.5 | A | 1 | 1 |
| 1.0 | В | 2 | 2 |
| 1.5 | \mathbf{C} | 1 | 3 |
| 0.5 | A | 2 | 4 |
| 1.0 | В | 1 | 5 |
| 1.5 | \mathbf{C} | 2 | 6 |
| 0.5 | A | 1 | 7 |
| 1.0 | В | 2 | 8 |
| 1.5 | \mathbf{C} | 1 | 9 |
| | | | |

Type conversion

To convert column into given datatype can be done using convert-types function. Not all the types can be converted automatically also some types require slow parsing (every conversion from string). In case where conversion is not possible you can pass conversion function.

Arguments:

- ds dataset
- Two options:
 - coltype-map in case when you want to convert several columns, keys are column names, vals are new types
 - column-selector and new-types column name and new datatype (or datatypes as sequence)

new-types can be:

- a type like :int64 or :string or sequence of types
- or sequence of pair of datetype and conversion function

After conversion additional infomation is given on problematic values.

The other conversion is casting column into java array (->array) of the type column or provided as argument. Grouped dataset returns sequence of arrays.

Basic conversion

```
(-> DS
     (api/convert-types :V1 :float64)
     (api/info :columns))
```

unnamed :column info [4 6]:

| :name | :datatype | :n-elems | :unparsed-indexes | :unparsed-data | :categorical? |
|-------|-----------|----------|-------------------|----------------|---------------|
| :V1 | :float64 | 9 | {} | | |
| :V2 | :int 64 | 9 | | | |
| :V3 | :float64 | 9 | | | |
| :V4 | :string | 9 | | | true |

Using custom converter. Let's treat : V4 as haxadecimal values. See that this way we can map column to any value.

```
(-> DS
     (api/convert-types :V4 [[:int16 #(Integer/parseInt % 16)]]))
```

$\underline{\text{unnamed } [9 \ 4]}$:

| :V1 | :V2 | :V3 | :V4 |
|------|-----|-----|-----|
| 1 | 1 | 0.5 | 10 |
| 2 | 2 | 1.0 | 11 |
| 1 | 3 | 1.5 | 12 |
| 2 | 4 | 0.5 | 10 |
| 1 | 5 | 1.0 | 11 |
| 2 | 6 | 1.5 | 12 |
| 1 | 7 | 0.5 | 10 |
| 2 | 8 | 1.0 | 11 |
| | | | |

```
    :V1
    :V2
    :V3
    :V4

    1
    9
    1.5
    12
```

You can process several columns at once

_unnamed :column info [4 5]:

| :name | :datatype | :n-elems | :unparsed-indexes | :unparsed-data |
|-------|-----------|----------|-------------------|----------------|
| :V1 | :float64 | 9 | {} | |
| :V2 | :object | 9 | {} | |
| :V3 | :boolean | 9 | {} | |
| :V4 | :object | 9 | | |

Convert one type into another

```
(-> DS
    (api/convert-types :type/numerical :int16)
    (api/info :columns))
```

_unnamed :column info [4 6]:

| :name | :datatype | :n-elems | :unparsed-indexes | : unparsed-data | :categorical? |
|-------|-----------|----------|-------------------|-----------------|---------------|
| :V1 | :int16 | 9 | {} | | |
| :V2 | :int16 | 9 | {} | | |
| :V3 | :int16 | 9 | {} | | |
| :V4 | :string | 9 | | | true |

Function works on the grouped dataset

```
(-> DS
     (api/group-by :V1)
     (api/convert-types :V1 :float32)
     (api/ungroup)
     (api/info :columns))
```

_unnamed :column info [4 6]:

| :name | :datatype | :n-elems | :unparsed-indexes | :unparsed-data | :categorical? |
|-------|-----------|----------|-------------------|----------------|---------------|
| :V4 | :string | 9 | | | true |

Double array conversion.

```
(api/->array DS :V1)
```

```
#object["[J" 0x261c926d "[J@261c926d"]
```

Function also works on grouped dataset

```
(-> DS
    (api/group-by : V3)
    (api/->array : V2))
```

```
 (\#object["[J"\ 0x2627a83a"]\ \#object["[J"\ 0x25972e23\ "[J@25972e23"]\ \#object["[J"\ 0x683febdd]\ )] \\
```

You can also cast the type to the other one (if casting is possible):

```
(api/->array DS :V4 :string)
(api/->array DS :V1 :float32)
```

```
#object["[Ljava.lang.String;" 0x3933e817 "[Ljava.lang.String;@3933e817"]
#object["[F" 0x2237c34a "[F@2237c34a"]
```

Rows

Rows can be selected or dropped using various selectors:

- row id(s) row index as number or sequence of numbers (first row has index 0, second 1 and so on)
- sequence of true/false values
- filter by predicate (argument is row as a map)

When predicate is used you may want to limit columns passed to the function (select-keys option).

Additionally you may want to precalculate some values which will be visible for predicate as additional columns. It's done internally by calling add-or-replace-columns on a dataset. :pre is used as a column definitions.

Select

Select fifth row

```
(api/select-rows DS 4)
```

_unnamed [1 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 5 | 1.0 | В |

Select 3 rows

(api/select-rows DS [1 4 5])

_unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 2 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |

Select rows using sequence of true/false values

```
(api/select-rows DS [true nil nil true])
```

 $\underline{}$ unnamed [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 4 | 0.5 | A |

Select rows using predicate

```
(api/select-rows DS (comp #(< % 1) :V3))</pre>
```

_unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 4 | 0.5 | A |
| 1 | 7 | 0.5 | A |

The same works on grouped dataset, let's select first row from every group.

```
(-> DS
    (api/group-by :V1)
    (api/select-rows 0)
    (api/ungroup))
```

 $\underline{\quad}$ unnamed [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |

If you want to select :V2 values which are lower than or equal mean in grouped dataset you have to precalculate it using :pre.

 $\underline{}$ unnamed [6 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 4 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 6 | 1.5 | С |

Drop

drop-rows removes rows, and accepts exactly the same parameters as select-rows

Drop values lower than or equal : V2 column mean in grouped dataset.

 $\underline{}$ unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 7 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |

Other

There are several function to select first, last, random rows, or display head, tail of the dataset. All functions work on grouped dataset.

All random functions accept :seed as an option if you want to fix returned result.

First row

```
(api/first DS)
```

 $\underline{\quad}$ unnamed [1 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |

Last row

(api/last DS)

 $\underline{\quad}$ unnamed [1 4]:

Random row (single)

(api/rand-nth DS)

_unnamed [1 4]:

Random row (single) with seed

(api/rand-nth DS {:seed 42})

 $\underline{\quad}$ unnamed [1 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 2 | 6 | 1.5 | С |

Random n (default: row count) rows with repetition.

(api/random DS)

 $\underline{\text{unnamed } [9 \ 4]}$:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 9 | 1.5 | С |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 5 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 2 | 4 | 0.5 | A |

Five random rows with repetition

(api/random DS 5)

 $\underline{}$ unnamed [5 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 3 | 1.5 | С |
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 2 | 4 | 0.5 | A |

Five random, non-repeating rows

(api/random DS 5 {:repeat? false})

 $\underline{}$ unnamed [5 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 9 | 1.5 | С |
| 1 | 7 | 0.5 | A |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 8 | 1.0 | В |
| 1 | 5 | 1.0 | В |

Five random, with seed

(api/random DS 5 {:seed 42})

 $\underline{}$ unnamed [5 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 6 | 1.5 | С |
| 1 | 5 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 1 | 0.5 | A |
| 1 | 9 | 1.5 | \mathbf{C} |

Shuffle dataset

(api/shuffle DS)

 $\underline{}$ unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 3 | 1.5 | С |
| 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 5 | 1.0 | В |
| 1 | 1 | 0.5 | Α |

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 2 | 1.0 | В |
| 2 | 4 | 0.5 | A |
| 1 | 9 | 1.5 | \mathbf{C} |
| 2 | 8 | 1.0 | В |
| 1 | 7 | 0.5 | A |

Shuffle with seed

(api/shuffle DS {:seed 42})

 $\underline{}$ unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 5 | 1.0 | В |
| 2 | 2 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 7 | 0.5 | A |
| 1 | 1 | 0.5 | A |
| 1 | 9 | 1.5 | С |

First n rows (default 5)

(api/head DS)

 $\underline{}$ unnamed [5 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |

Last n rows (default 5)

(api/tail DS)

 $\underline{}$ unnamed [5 4]:

| :V1 | :V2 | :V3 | :V4 |
|------|-----|-----|-----------------|
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | $^{\mathrm{C}}$ |
| 1 | 7 | 0.5 | A |
| 2 | 8 | 1.0 | В |

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 9 | 1.5 | С |

by-rank calculates rank on column(s). It's base on R rank() with addition of :dense (default) tie strategy which give consecutive rank numbering.

:desc? options (default: true) sorts input with descending order, giving top values under 0 value.

rank is zero based and is defined at tablecloth.api.utils namespace.

```
(api/by-rank DS : V3 zero?) ;; most V3 values
```

_unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 3 | 1.5 | С |
| 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 9 | 1.5 | \mathbf{C} |

```
(api/by-rank DS : V3 zero? {:desc? false}) ;; least V3 values
```

 $\underline{\quad}$ unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 4 | 0.5 | A |
| 1 | 7 | 0.5 | A |

Rank also works on multiple columns

```
(api/by-rank DS [:V1 :V3] zero? {:desc? false})
```

 $\underline{\quad}$ unnamed [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 1 | 7 | 0.5 | A |
| | | | |

Select 5 random rows from each group

```
(-> DS
    (api/group-by :V4)
    (api/random 5)
    (api/ungroup))
```

_unnamed [15 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----------------|
| 1 | 1 | 0.5 | A |
| 2 | 4 | 0.5 | A |
| 1 | 1 | 0.5 | A |
| 2 | 4 | 0.5 | A |
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 2 | 2 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 2 | 8 | 1.0 | В |
| 1 | 3 | 1.5 | $^{\mathrm{C}}$ |
| 1 | 9 | 1.5 | $^{\mathrm{C}}$ |
| 1 | 9 | 1.5 | \mathbf{C} |
| 1 | 9 | 1.5 | \mathbf{C} |
| 1 | 3 | 1.5 | \mathbf{C} |
| | | | |

Aggregate

Aggregating is a function which produces single row out of dataset.

Aggregator is a function or sequence or map of functions which accept dataset as an argument and result single value, sequence of values or map.

Where map is given as an input or result, keys are treated as column names.

Grouped dataset is ungrouped after aggreation. This can be turned off by setting :ungroup to false. In case you want to pass additional ungrouping parameters add them to the options.

By default resulting column names are prefixed with summary prefix (set it with :default-column-name-prefix option).

Sequential result is spread into separate columns

```
(api/aggregate DS #(take 5(% :V2)))
```

 $\underline{}$ unnamed [1 5]:

| :summary-0 | :summary-1 | :summary-2 | :summary-3 | :summary-4 |
|------------|------------|------------|------------|------------|
| 1 | 2 | 3 | 4 | 5 |

You can combine all variants and rename default prefix

_unnamed [1 5]:

| :V2-value-0-0 | :V2-value-0-1 | :V2-value-0-2 | :V2-value-1-sum-v1 | :V2-value-1-prod-v3 |
|---------------|---------------|---------------|--------------------|---------------------|
| 1 | 2 | 3 | 13 | 0.421875 |

Processing grouped dataset

_unnamed [3 6]:

| :V4 | $: \!\! V2\text{-}value \text{-}0\text{-}0$ | :V2-value-0-1 | $: \!\! V2\text{-}value\text{-}0\text{-}2$ | : V2-value-1-sum-v1 | :V2-value-1-prod-v3 |
|--------------|---|---------------|--|---------------------|---------------------|
| В | 2 | 5 | 8 | 5 | 1.000 |
| \mathbf{C} | 3 | 6 | 9 | 4 | 3.375 |
| A | 1 | 4 | 7 | 4 | 0.125 |

Result of aggregating is automatically ungrouped, you can skip this step by stetting :ungroup option to false.

_unnamed [3 3]:

| :name | :group-id | :data |
|----------------|-----------|-------------------------------|
| {:V3 1.0} | 0 | _unnamed [1 5]: |
| $\{:V3\ 0.5\}$ | 1 | $\underline{}$ unnamed [1 5]: |

| :name | :group-id | :data |
|-----------|-----------|-----------------|
| {:V3 1.5} | 2 | _unnamed [1 5]: |

Column

You can perform columnar aggregation also. aggregate-columns selects columns and apply aggregating function (or sequence of functions) for each column separately.

```
(api/aggregate-columns DS [:V1 :V2 :V3] #(reduce + %))
```

 $\underline{\quad}$ unnamed [1 3]:

unnamed $[1\ 3]$:

```
(-> DS
    (api/group-by [:V4])
    (api/aggregate-columns [:V1 :V2 :V3] #(reduce + %)))
```

 $\underline{\quad}$ unnamed [3 4]:

| 15 | 3.0 |
|----|-----|
| 18 | 4.5 |
| 12 | 1.5 |
| | 18 |

Order

Ordering can be done by column(s) or any function operating on row. Possible order can be:

- :asc for ascending order (default)
- :desc for descending order
- custom comparator

:select-keys limits row map provided to ordering functions.

Order by single column, ascending

(api/order-by DS :V1)

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 5 | 1.0 | В |
| 1 | 7 | 0.5 | A |
| 1 | 9 | 1.5 | \mathbf{C} |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 2 | 2 | 1.0 | В |

Descending order

(api/order-by DS :V1 :desc)

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----------------|
| 2 | 2 | 1.0 | В |
| 2 | 4 | 0.5 | A |
| 2 | 6 | 1.5 | $^{\mathrm{C}}$ |
| 2 | 8 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 7 | 0.5 | A |
| 1 | 1 | 0.5 | A |
| 1 | 9 | 1.5 | С |

Order by two columns

(api/order-by DS [:V1 :V2])

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----------------|
| 1 | 1 | 0.5 | A |
| 1 | 3 | 1.5 | $^{\mathrm{C}}$ |
| 1 | 5 | 1.0 | В |
| 1 | 7 | 0.5 | A |
| 1 | 9 | 1.5 | $^{\mathrm{C}}$ |
| 2 | 2 | 1.0 | В |
| 2 | 4 | 0.5 | A |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 8 | 1.0 | В |

Use different orders for columns

```
(api/order-by DS [:V1 :V2] [:asc :desc])
```

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 9 | 1.5 | С |
| 1 | 7 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 1 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 2 | 2 | 1.0 | В |

```
(api/order-by DS [:V1 :V2] [:desc :desc])
```

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 8 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |
| 1 | 7 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 1 | 0.5 | A |

```
(api/order-by DS [:V1 :V3] [:desc :asc])
```

 $\underline{}$ unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 4 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 2 | 8 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 1 | 0.5 | A |
| 1 | 7 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 1 | 9 | 1.5 | \mathbf{C} |

Custom function can be used to provided ordering key. Here order by :V4 descending, then by product of

other columns ascending.

 $\underline{\quad}$ unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|----------------|
| 1 | 3 | 1.5 | \overline{C} |
| 1 | 9 | 1.5 | \mathbf{C} |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 2 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 2 | 8 | 1.0 | В |
| 1 | 1 | 0.5 | A |
| 1 | 7 | 0.5 | A |
| 2 | 4 | 0.5 | A |
| | | | |

Custom comparator also can be used in case objects are not comparable by default. Let's define artificial one: if Euclidean distance is lower than 2, compare along z else along x and y. We use first three columns for that.

#'user/dist

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 1 | 7 | 0.5 | A |
| 1 | 9 | 1.5 | \mathbf{C} |
| 2 | 2 | 1.0 | В |
| 2 | 4 | 0.5 | A |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 6 | 1.5 | \mathbf{C} |
| 2 | 8 | 1.0 | В |
| | | | |

Unique

Remove rows which contains the same data. By default unique-by removes duplicates from whole dataset. You can also pass list of columns or functions (similar as in group-by) to remove duplicates limited by them. Default strategy is to keep the first row. More strategies below.

unique-by works on groups

Remove duplicates from whole dataset

(api/unique-by DS)

 $\underline{\text{unnamed } [9 \ 4]}$:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 7 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |
| | | | |

Remove duplicates from each group selected by column.

(api/unique-by DS : V1)

 $\underline{\quad}$ unnamed [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |

Pair of columns

(api/unique-by DS [:V1 :V3])

 $\underline{\text{unnamed } [6 \ 4]}$:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |

Also function can be used, split dataset by modulo 3 on columns : V2

```
(api/unique-by DS (fn [m] (mod (:V2 m) 3)))
```

_unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |

The same can be achived with group-by

```
(-> DS
    (api/group-by (fn [m] (mod (:V2 m) 3)))
    (api/first)
    (api/ungroup))
```

 $\underline{}$ unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 3 | 1.5 | С |
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 1 | 0.5 | Ā |

Grouped dataset

```
(-> DS
    (api/group-by :V4)
    (api/unique-by :V1)
    (api/ungroup))
```

 $\underline{\quad}$ unnamed [6 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 4 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 5 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 6 | 1.5 | \mathbf{C} |

Strategies

There are 4 strategies defined:

- :first select first row (default)
- :last select last row
- :random select random row
- any function apply function to a columns which are subject of uniqueness

Last

```
(api/unique-by DS :V1 {:strategy :last})
```

 $\underline{}$ unnamed [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |

Random

```
(api/unique-by DS :V1 {:strategy :random})
```

 $\underline{\quad}$ unnamed [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 4 | 0.5 | A |
| 1 | 9 | 1.5 | \mathbf{C} |

Pack columns into vector

```
(api/unique-by DS :V4 {:strategy vec})
```

 $\underline{}$ unnamed [3 3]:

| :V1 | :V2 | :V3 |
|---------|---------|---------------|
| [2 1 2] | [2 5 8] | [1.0 1.0 1.0] |
| [1 2 1] | [3 6 9] | [1.5 1.5 1.5] |
| [1 2 1] | [1 4 7] | [0.5 0.5 0.5] |

Sum columns

```
(api/unique-by DS :V4 {:strategy (partial reduce +)})
```

_unnamed [3 3]:

| :V1 | :V2 | :V3 |
|-----|-----|-----|
| 5 | 15 | 3.0 |
| 4 | 18 | 4.5 |
| 4 | 12 | 1.5 |

Group by function and apply functions

```
(api/unique-by DS (fn [m] (mod (:V2 m) 3)) {:strategy vec})
```

_unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|---|-------------------------------|---|---|
| $ \begin{array}{c c} \hline [1 \ 2 \ 1] \\ [1 \ 2 \ 1] \\ [2 \ 1 \ 2] \end{array} $ | [3 6 9] [1 4 7] [2 5 8] | [1.5 1.5 1.5] [0.5 0.5 0.5] [1.0 1.0 1.0] | ["C" "C" "C"] ["A" "A" "A"] ["B" "B" "B"] |

Grouped dataset

```
(-> DS
    (api/group-by :V1)
    (api/unique-by (fn [m] (mod (:V2 m) 3)) {:strategy vec})
    (api/ungroup {:add-group-as-column :from-V1}))
```

 $\underline{}$ unnamed [6 5]:

| :from-V1 | :V1 | :V2 | :V3 | :V4 |
|----------|-----------|-----------|---------------|-----------|
| 1 | [1 1] | [3 9] | $[1.5 \ 1.5]$ | ["C" "C"] |
| 1 | $[1 \ 1]$ | $[1 \ 7]$ | $[0.5 \ 0.5]$ | ["A" "A"] |
| 1 | [1] | [5] | [1.0] | ["B"] |
| 2 | [2] | [6] | [1.5] | ["C"] |
| 2 | [2] | [4] | [0.5] | ["A"] |
| 2 | $[2 \ 2]$ | $[2 \ 8]$ | $[1.0 \ 1.0]$ | ["B" "B"] |

Missing

When dataset contains missing values you can select or drop rows with missing values or replace them using some strategy.

column-selector can be used to limit considered columns

Let's define dataset which contains missing values

 \mathtt{DSm}

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| | 3 | | \mathbf{C} |
| 1 | 4 | 1.5 | A |
| 2 | 5 | 0.5 | В |
| | 6 | 1.0 | \mathbf{C} |
| 1 | 7 | | A |

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|------------|-----|
| 2 | 8 9 | 1.5 0.5 | ВС |

Select

Select rows with missing values

(api/select-missing DSm)

_unnamed [4 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| | 3 | | С |
| | 6 | 1.0 | \mathbf{C} |
| 1 | 7 | | A |
| | 9 | 0.5 | \mathbf{C} |

Select rows with missing values in $: \mathtt{V1}$

(api/select-missing DSm :V1)

_unnamed [3 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| | 3 | | С |
| | 6 | 1.0 | \mathbf{C} |
| | 9 | 0.5 | \mathbf{C} |
| | | | |

The same with grouped dataset

```
(-> DSm
    (api/group-by :V4)
    (api/select-missing :V3)
    (api/ungroup))
```

 $\underline{\quad}$ unnamed [2 4]:

Drop

Drop rows with missing values

(api/drop-missing DSm)

 $\underline{\text{unnamed } [5 \ 4]}$:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 4 | 1.5 | A |
| 2 | 5 | 0.5 | В |
| 2 | 8 | 1.5 | В |

Drop rows with missing values in :V1

```
(api/drop-missing DSm :V1)
```

_unnamed [6 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 4 | 1.5 | A |
| 2 | 5 | 0.5 | В |
| 1 | 7 | | A |
| 2 | 8 | 1.5 | В |

The same with grouped dataset

```
(-> DSm
    (api/group-by :V4)
    (api/drop-missing :V1)
    (api/ungroup))
```

_unnamed [6 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 1 | 4 | 1.5 | A |
| 1 | 7 | | A |
| 2 | 2 | 1.0 | В |
| 2 | 5 | 0.5 | В |
| 2 | 8 | 1.5 | В |

Replace

Missing values can be replaced using several strategies. replace-missing accepts:

- dataset
- column selector, default: :all
- strategy, default: :mid
- value (optional)
 - single value
 - sequence of values (cycled)
 - function, applied on column(s) with stripped missings

Strategies are:

- :value replace with given value
- :up copy values up and then down for missing values at the end
- :down copy values down and then up for missing values at the beginning
- :mid copy values around known values
- :lerp trying to lineary approximate values, works for numbers and datetime, otherwise applies :mid

Let's define special dataset here:

_unnamed [15 2]:

| :a | :l |
|-----|----|
| | 2 |
| | 2 |
| | 2 |
| 1.0 | |
| 2.0 | |

$$\begin{array}{ccc}
 & 13 \\
 & 3 \\
 & 11.0 & 4 \\
 & 5 \\
 & 5
\end{array}$$

Replace missing with default strategy for all columns

(api/replace-missing DSm2)

_unnamed [15 2]:

| :a | :b |
|------|----|
| 1.0 | 2 |
| 1.0 | 2 |
| 1.0 | 2 |
| 1.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 13 |
| 2.0 | 13 |
| 4.0 | 13 |
| 4.0 | 13 |
| 4.0 | 13 |
| 4.0 | 3 |
| 11.0 | 4 |

```
    :a
    :b

    11.0
    5

    11.0
    5
```

Replace missing with single value in whole dataset

```
(api/replace-missing DSm2 :all :value 999)
```

 $\underline{\quad} unnamed~[15~2]:$

| :a | :b |
|-------|-----|
| 999.0 | 2 |
| 999.0 | 2 |
| 999.0 | 2 |
| 1.0 | 999 |
| 2.0 | 999 |
| 999.0 | 999 |
| 999.0 | 999 |
| 999.0 | 999 |
| 999.0 | 999 |
| 999.0 | 13 |
| 4.0 | 999 |
| 999.0 | 3 |
| 11.0 | 4 |
| 999.0 | 5 |
| 999.0 | 5 |
| | |

Replace missing with single value in $: a\ {\rm column}$

```
(api/replace-missing DSm2 :a :value 999)
```

_unnamed [15 2]:

| :a | :b |
|-------|----|
| 999.0 | 2 |
| 999.0 | 2 |
| 999.0 | 2 |
| 1.0 | |
| 2.0 | |
| 999.0 | |
| 999.0 | |
| 999.0 | |
| 999.0 | |
| 999.0 | 13 |
| 4.0 | |
| 999.0 | 3 |
| 11.0 | 4 |
| 999.0 | 5 |
| 999.0 | 5 |
| | |

```
Replace missing with sequence in :a column
```

```
(api/replace-missing DSm2 :a :value [-999 -998 -997])
```

_unnamed [15 2]:

| :a | :b |
|--------|----|
| -999.0 | 2 |
| -998.0 | 2 |
| -997.0 | 2 |
| 1.0 | |
| 2.0 | |
| -999.0 | |
| -998.0 | |
| -997.0 | |
| -999.0 | |
| -998.0 | 13 |
| 4.0 | |
| -997.0 | 3 |
| 11.0 | 4 |
| -999.0 | 5 |
| -998.0 | 5 |
| | |

Replace missing with a function (mean)

```
(api/replace-missing DSm2 :a :value tech.v3.datatype.functional/mean)
```

_unnamed [15 2]:

| :a | :b |
|------|----|
| 4.5 | 2 |
| 4.5 | 2 |
| 4.5 | 2 |
| 1.0 | |
| 2.0 | |
| 4.5 | |
| 4.5 | |
| 4.5 | |
| 4.5 | |
| 4.5 | 13 |
| 4.0 | |
| 4.5 | 3 |
| 11.0 | 4 |
| 4.5 | 5 |
| 4.5 | 5 |
| | |

Using :down strategy, fills gaps with values from above. You can see that if missings are at the beginning, the are filled with first value

(api/replace-missing DSm2 [:a :b] :down)

_unnamed [15 2]:

| :a | :b |
|------|----|
| 1.0 | 2 |
| 1.0 | 2 |
| 1.0 | 2 |
| 1.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 13 |
| 4.0 | 13 |
| 4.0 | 3 |
| 11.0 | 4 |
| 11.0 | 5 |
| 11.0 | 5 |
| | |

To fix above issue you can provide value

```
(api/replace-missing DSm2 [:a :b] :down 999)
```

_unnamed [15 2]:

| :a | :b |
|-------|----|
| 999.0 | 2 |
| 999.0 | 2 |
| 999.0 | 2 |
| 1.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 2 |
| 2.0 | 13 |
| 4.0 | 13 |
| 4.0 | 3 |
| 11.0 | 4 |
| 11.0 | 5 |
| 11.0 | 5 |
| | |

The same applies for :up strategy which is opposite direction.

```
(api/replace-missing DSm2 [:a :b] :up)
```

_unnamed [15 2]:

:b :a 2 1.0 1.0 2 2 1.0 1.0 13 2.0 13 4.0 13 4.013 4.0 13 4.0 13 13 4.0 4.0 3 11.0 3 11.0 11.0 5 11.0

We can use a function which is applied after applying :up or :down

(api/replace-missing DSm2 [:a :b] :down tech.v3.datatype.functional/mean)

_unnamed [15 2]:

| :a | :b |
|------|----|

Inject

When your column contains not continuous data range you can fill up with lacking values. Arguments:

- dataset
- column name
- expected step (max-span, milliseconds in case of datetime column)
- (optional) missing-strategy how to replace missing, default :down (set to nil if none)
- (optional) missing-value optional value for replace missing

 $\underline{}$ unnamed [9 2]:

| :a | :b |
|-----|----|
| 1.0 | :a |
| 2.0 | :b |
| 3.0 | :b |
| 4.0 | :b |
| 5.0 | :b |
| 6.0 | :b |
| 7.0 | :b |
| 8.0 | :b |
| 9.0 | :c |
| | |

Join/Separate Columns

Joining or separating columns are operations which can help to tidy messy dataset.

- join-columns joins content of the columns (as string concatenation or other structure) and stores it in new column
- separate-column splits content of the columns into set of new columns

Join

join-columns accepts:

- dataset
- column selector (as in select-columns)
- options
 - :separator (default "-")
 - :drop-columns? whether to drop source columns or not (default true)
 - :result-type
 - * :map packs data into map
 - * :seq packs data into sequence
 - * :string join strings with separator (default)
 - * or custom function which gets row as a vector
 - :missing-subst substitution for missing value

Default usage. Create: joined column out of other columns.

```
(api/join-columns DSm :joined [:V1 :V2 :V4])
```

$\underline{\quad}$ unnamed [9 2]:

| :V3 | :joined |
|-----|-----------|
| 0.5 | 1-1-A |
| 1.0 | 2-2-B |
| | 3-C |
| 1.5 | 1-4-A |
| 0.5 | 2 - 5 - B |
| 1.0 | 6-C |
| | 1-7-A |
| 1.5 | 2 - 8 - B |
| 0.5 | 9-C |
| | |

Without dropping source columns.

```
(api/join-columns DSm :joined [:V1 :V2 :V4] {:drop-columns? false})
```

_unnamed [9 5]:

| :V1 | :V2 | :V3 | :V4 | :joined |
|-----|-----|-----|--------------|--------------------------------|
| 1 | 1 | 0.5 | A | 1-1-A |
| 2 | 2 | 1.0 | В | 2-2-B |
| | 3 | | С | 3-C |
| 1 | 4 | 1.5 | \mathbf{A} | 1-4-A |
| 2 | 5 | 0.5 | В | $2\text{-}5\text{-}\mathrm{B}$ |
| | 6 | 1.0 | \mathbf{C} | 6-C |
| 1 | 7 | | \mathbf{A} | 1-7-A |
| 2 | 8 | 1.5 | В | 2 - 8 - B |
| | 9 | 0.5 | \mathbf{C} | 9-C |
| | | | | |

Let's replace missing value with "NA" string.

```
(api/join-columns DSm :joined [:V1 :V2 :V4] {:missing-subst "NA"})
```

_unnamed [9 2]:

| :V3 | :joined |
|-----|-----------|
| 0.5 | 1-1-A |
| 1.0 | 2 - 2 - B |
| | NA-3-C |
| 1.5 | 1-4-A |
| 0.5 | 2 - 5 - B |
| 1.0 | NA-6-C |
| | 1-7-A |
| 1.5 | 2 - 8 - B |
| 0.5 | NA-9-C |

We can use custom separator.

_unnamed [9 2]:

| :joined |
|---------|
| 1/1/A |
| 2/2/B |
| ./3/C |
| 1/4/A |
| 2/5/B |
| ./6/C |
| 1/7/A |
| 2/8/B |
| |

```
:V3 :joined
0.5 ./9/C
```

Or even sequence of separators.

 $\underline{}$ unnamed [9 2]:

| :V3 | :joined |
|-----|---------|
| 0.5 | 1-1/A |
| 1.0 | 2-2/B |
| | 3/C |
| 1.5 | 1-4/A |
| 0.5 | 2-5/B |
| 1.0 | 6/C |
| | 1-7/A |
| 1.5 | 2 - 8/B |
| 0.5 | 9/C |
| | |

The other types of results, map:

```
(api/join-columns DSm :joined [:V1 :V2 :V4] {:result-type :map})
```

 $\underline{}$ unnamed [9 2]:

| :V3 | :joined |
|-----|---------------------------|
| 0.5 | {:V1 1, :V2 1, :V4 "A"} |
| 1.0 | {:V1 2, :V2 2, :V4 "B"} |
| | {:V1 nil, :V2 3, :V4 "C"} |
| 1.5 | {:V1 1, :V2 4, :V4 "A"} |
| 0.5 | {:V1 2, :V2 5, :V4 "B"} |
| 1.0 | {:V1 nil, :V2 6, :V4 "C"} |
| | {:V1 1, :V2 7, :V4 "A"} |
| 1.5 | {:V1 2, :V2 8, :V4 "B"} |
| 0.5 | {:V1 nil, :V2 9, :V4 "C"} |

Sequence

```
(api/join-columns DSm :joined [:V1 :V2 :V4] {:result-type :seq})
```

_unnamed [9 2]:

```
:V3 :joined

0.5 (1 1 "A")

1.0 (2 2 "B")

(nil 3 "C")
```

| :V3 | :joined |
|-----|-------------|
| 1.5 | (1 4 "A") |
| 0.5 | (25 "B") |
| 1.0 | (nil 6 "C") |
| | (1 7 "A") |
| 1.5 | (2 8 "B") |
| 0.5 | (nil 9 "C") |

Custom function, calculate hash

```
(api/join-columns DSm :joined [:V1 :V2 :V4] {:result-type hash})
```

_unnamed [9 2]:

| :V3 | :joined |
|-----|-------------|
| 0.5 | 535226087 |
| 1.0 | 1128801549 |
| | -1842240303 |
| 1.5 | 2022347171 |
| 0.5 | 1884312041 |
| 1.0 | -1555412370 |
| | 1640237355 |
| 1.5 | -967279152 |
| 0.5 | 1128367958 |
| | |

Grouped dataset

```
(-> DSm
    (api/group-by :V4)
    (api/join-columns :joined [:V1 :V2 :V4])
    (api/ungroup))
```

$\underline{}$ unnamed [9 2]:

| :V3 | :joined |
|-----|--------------------------------|
| 0.5 | 1-1-A |
| 1.5 | 1-4-A |
| | 1-7-A |
| 1.0 | 2-2-B |
| 0.5 | $2\text{-}5\text{-}\mathrm{B}$ |
| 1.5 | 2 - 8 - B |
| | 3-C |
| 1.0 | 6-C |
| 0.5 | 9-C |
| | |

a
b
```

_unnamed [4 3]:

 $\underline{\quad}$ unnamed [4 3]:

Separate

Column can be also separated into several other columns using string as separator, regex or custom function. Arguments:

- dataset
- source column
- target columns can be nil or :infer if separator returns map
- separator as:
 - string it's converted to regular expression and passed to clojure.string/split function
 - regex

- or custom function (default: identity)
- options
 - :drop-columns? whether drop source column(s) or not (default: true or :all in case of empty target-columns). When set to :all keeps only separation result.
 - :missing-subst values which should be treated as missing, can be set, sequence, value or function (default: "")

Custom function (as separator) should return sequence of values for given value.

Separate float into integer and factional values

_unnamed [9 5]:

| :V1 | :V2 | :int-part | :frac-part | :V4 |
|-----|-----|-----------|------------|--------------|
| 1 | 1 | 0 | 0.5 | A |
| 2 | 2 | 1 | 0.0 | В |
| 1 | 3 | 1 | 0.5 | \mathbf{C} |
| 2 | 4 | 0 | 0.5 | A |
| 1 | 5 | 1 | 0.0 | В |
| 2 | 6 | 1 | 0.5 | \mathbf{C} |
| 1 | 7 | 0 | 0.5 | A |
| 2 | 8 | 1 | 0.0 | В |
| 1 | 9 | 1 | 0.5 | \mathbf{C} |

Source column can be kept

_unnamed [9 6]:

| :V1 | :V2 | :V3 | :int-part | :frac-part | :V4 |
|-----|-----|-----|-----------|------------|--------------|
| 1 | 1 | 0.5 | 0 | 0.5 | A |
| 2 | 2 | 1.0 | 1 | 0.0 | В |
| 1 | 3 | 1.5 | 1 | 0.5 | \mathbf{C} |
| 2 | 4 | 0.5 | 0 | 0.5 | A |
| 1 | 5 | 1.0 | 1 | 0.0 | В |
| 2 | 6 | 1.5 | 1 | 0.5 | \mathbf{C} |
| 1 | 7 | 0.5 | 0 | 0.5 | A |
| 2 | 8 | 1.0 | 1 | 0.0 | В |
| 1 | 9 | 1.5 | 1 | 0.5 | \mathbf{C} |

We can treat 0 or 0.0 as missing value

_unnamed [9 5]:

| :V1 | :V2 | :int-part | :frac-part | :V4 |
|-----|-----|-----------|------------|--------------|
| 1 | 1 | | 0.5 | A |
| 2 | 2 | 1 | | В |
| 1 | 3 | 1 | 0.5 | \mathbf{C} |
| 2 | 4 | | 0.5 | A |
| 1 | 5 | 1 | | В |
| 2 | 6 | 1 | 0.5 | \mathbf{C} |
| 1 | 7 | | 0.5 | A |
| 2 | 8 | 1 | | В |
| 1 | 9 | 1 | 0.5 | \mathbf{C} |

Works on grouped dataset

_unnamed [9 5]:

| :V1 | :V2 | :int-part | :fract-part | :V4 |
|-----|-----|-----------|-------------|--------------|
| 1 | 1 | 0 | 0.5 | A |
| 2 | 4 | 0 | 0.5 | A |
| 1 | 7 | 0 | 0.5 | A |
| 2 | 2 | 1 | 0.0 | В |
| 1 | 5 | 1 | 0.0 | В |
| 2 | 8 | 1 | 0.0 | В |
| 1 | 3 | 1 | 0.5 | \mathbf{C} |
| 2 | 6 | 1 | 0.5 | \mathbf{C} |
| 1 | 9 | 1 | 0.5 | \mathbf{C} |

Separate using separator returning sequence of maps, in this case we drop all other columns.

_unnamed [9 2]:

| :int-part | :fract-part |
|-----------|-------------|
| 0 | 0.5 |
| 1 | 0.0 |

| :int-part | :fract-part |
|-----------|-------------|
| 1 | 0.5 |
| 0 | 0.5 |
| 1 | 0.0 |
| 1 | 0.5 |
| 0 | 0.5 |
| 1 | 0.0 |
| 1 | 0.5 |
| | |

Keeping all columns

$\underline{}$ unnamed [9 6]:

| :V1 | :V2 | :V3 | :int-part | :fract-part | :V4 |
|-----|-----|-----|-----------|-------------|--------------|
| 1 | 1 | 0.5 | 0 | 0.5 | A |
| 2 | 2 | 1.0 | 1 | 0.0 | В |
| 1 | 3 | 1.5 | 1 | 0.5 | \mathbf{C} |
| 2 | 4 | 0.5 | 0 | 0.5 | A |
| 1 | 5 | 1.0 | 1 | 0.0 | В |
| 2 | 6 | 1.5 | 1 | 0.5 | \mathbf{C} |
| 1 | 7 | 0.5 | 0 | 0.5 | A |
| 2 | 8 | 1.0 | 1 | 0.0 | В |
| 1 | 9 | 1.5 | 1 | 0.5 | \mathbf{C} |

Join and separate together.

```
(-> DSm
    (api/join-columns :joined [:V1 :V2 :V4] {:result-type :map})
    (api/separate-column :joined [:V1 :V2 :V4] (juxt :V1 :V2 :V4)))
```

Split with regex

Fold/Unroll Rows

To pack or unpack the data into single value you can use fold-by and unroll functions.

fold-by groups dataset and packs columns data from each group separately into desired datastructure (like vector or sequence). unroll does the opposite.

Fold-by

Group-by and pack columns into vector

```
(api/fold-by DS [:V3 :V4 :V1])
```

 $\underline{}$ unnamed [6 4]:

| :V3 | :V1 | :V2 |
|-----|---------------------------------|---|
| 1.0 | 1 | [5] |
| 1.5 | 2 | [6] |
| 1.5 | 1 | $[3 \ 9]$ |
| 0.5 | 1 | $[1 \ 7]$ |
| 1.0 | 2 | $[2 \ 8]$ |
| 0.5 | 2 | [4] |
| | 1.0 1.5 1.5 0.5 1.0 | 1.0 1 1.5 2 1.5 1 0.5 1 1.0 2 |

You can pack several columns at once.

(api/fold-by DS [:V4])

 $\underline{}$ unnamed [3 4]:

| :V4 | :V1 | :V2 | :V3 |
|--------------|---------------|---------------|---------------------|
| В | [2 1 2] | $[2\ 5\ 8]$ | [1.0 1.0 1.0] |
| \mathbf{C} | $[1 \ 2 \ 1]$ | [3 6 9] | $[1.5 \ 1.5 \ 1.5]$ |
| A | $[1 \ 2 \ 1]$ | $[1 \ 4 \ 7]$ | $[0.5 \ 0.5 \ 0.5]$ |

You can use custom packing function

```
(api/fold-by DS [:V4] seq)
```

 $\underline{}$ unnamed [3 4]:

| :V4 | :V1 | :V2 | :V3 |
|--------------|-------------|-------------|---------------------|
| В | $(2\ 1\ 2)$ | $(2\ 5\ 8)$ | $(1.0 \ 1.0 \ 1.0)$ |
| \mathbf{C} | $(1\ 2\ 1)$ | (3 6 9) | $(1.5 \ 1.5 \ 1.5)$ |
| A | $(1\ 2\ 1)$ | $(1\ 4\ 7)$ | $(0.5 \ 0.5 \ 0.5)$ |

or

```
(api/fold-by DS [:V4] set)
```

 $\underline{}$ unnamed [3 4]:

| :V4 | :V1 | :V2 | :V3 |
|--------------|--------------|-----------------|-------------|
| В | #{1 2} | #{2 5 8} | #{1.0} |
| \mathbf{C} | $\#\{1\ 2\}$ | $\#\{6\ 3\ 9\}$ | $\#\{1.5\}$ |
| A | $\#\{1\ 2\}$ | $\#\{7\ 1\ 4\}$ | $\#\{0.5\}$ |

This works also on grouped dataset

```
(-> DS
    (api/group-by :V1)
    (api/fold-by :V4)
    (api/ungroup))
```

 $\underline{}$ unnamed [6 4]:

| :V4 | :V1 | :V2 | :V3 |
|--------------|-----------|-----------|---------------|
| В | [1] | [5] | [1.0] |
| \mathbf{C} | $[1\ 1]$ | $[3 \ 9]$ | $[1.5 \ 1.5]$ |
| A | $[1 \ 1]$ | $[1 \ 7]$ | $[0.5 \ 0.5]$ |
| В | $[2 \ 2]$ | $[2\ 8]$ | $[1.0 \ 1.0]$ |
| \mathbf{C} | [2] | [6] | [1.5] |
| A | [2] | [4] | [0.5] |

Unroll

unroll unfolds sequences stored in data, multiplying other ones when necessary. You can unroll more than one column at once (folded data should have the same size!).

Options:

- :indexes? if true (or column name), information about index of unrolled sequence is added.
- :datatypes list of datatypes which should be applied to restored columns, a map

Unroll one column

```
(api/unroll (api/fold-by DS [:V4]) [:V1])
```

_unnamed [9 4]:

| :V4 | :V2 | :V3 | :V1 |
|--------------|---------------|---------------------|-----|
| В | [2 5 8] | [1.0 1.0 1.0] | 2 |
| В | $[2\ 5\ 8]$ | $[1.0 \ 1.0 \ 1.0]$ | 1 |
| В | $[2\ 5\ 8]$ | $[1.0 \ 1.0 \ 1.0]$ | 2 |
| \mathbf{C} | $[3 \ 6 \ 9]$ | $[1.5 \ 1.5 \ 1.5]$ | 1 |
| \mathbf{C} | $[3\ 6\ 9]$ | $[1.5 \ 1.5 \ 1.5]$ | 2 |
| \mathbf{C} | $[3\ 6\ 9]$ | $[1.5 \ 1.5 \ 1.5]$ | 1 |
| A | $[1 \ 4 \ 7]$ | $[0.5 \ 0.5 \ 0.5]$ | 1 |
| A | $[1 \ 4 \ 7]$ | $[0.5 \ 0.5 \ 0.5]$ | 2 |
| A | $[1 \ 4 \ 7]$ | $[0.5 \ 0.5 \ 0.5]$ | 1 |

Unroll all folded columns

```
(api/unroll (api/fold-by DS [:V4]) [:V1 :V2 :V3])
```

_unnamed [9 4]:

| :V4 | :V1 | :V2 | :V3 |
|--------------|------|-----|--------|
| В | 2 | 2 | 1.000 |
| В | 1 | 5 | 1.000 |
| В | 2 | 8 | 1.000 |
| \mathbf{C} | 1 | 3 | 1.500 |
| \mathbf{C} | 2 | 6 | 1.500 |
| \mathbf{C} | 1 | 9 | 1.500 |
| A | 1 | 1 | 0.5000 |
| A | 2 | 4 | 0.5000 |
| A | 1 | 7 | 0.5000 |

Unroll one by one leads to cartesian product

_unnamed [15 4]:

| :V4 | :V1 | :V2 | :V3 |
|-------------------------|-----|-----|--------|
| $\overline{\mathrm{C}}$ | 2 | 6 | 1.500 |
| A | 1 | 1 | 0.5000 |
| A | 1 | 1 | 0.5000 |
| A | 1 | 7 | 0.5000 |
| A | 1 | 7 | 0.5000 |
| В | 1 | 5 | 1.000 |
| \mathbf{C} | 1 | 3 | 1.500 |
| \mathbf{C} | 1 | 3 | 1.500 |
| \mathbf{C} | 1 | 9 | 1.500 |
| \mathbf{C} | 1 | 9 | 1.500 |
| A | 2 | 4 | 0.5000 |
| В | 2 | 2 | 1.000 |
| В | 2 | 2 | 1.000 |
| В | 2 | 8 | 1.000 |
| В | 2 | 8 | 1.000 |
| | | | |

You can add indexes

```
(api/unroll (api/fold-by DS [:V1]) [:V4 :V2 :V3] {:indexes? true})
```

_unnamed [9 5]:

| :V1 | :indexes | :V2 | :V3 | :V4 |
|-----|----------|-----|--------|--------------|
| 1 | 0 | 1 | 0.5000 | A |
| 1 | 1 | 3 | 1.500 | \mathbf{C} |
| 1 | 2 | 5 | 1.000 | В |
| 1 | 3 | 7 | 0.5000 | A |
| 1 | 4 | 9 | 1.500 | \mathbf{C} |
| 2 | 0 | 2 | 1.000 | В |
| 2 | 1 | 4 | 0.5000 | A |
| 2 | 2 | 6 | 1.500 | \mathbf{C} |
| 2 | 3 | 8 | 1.000 | В |

```
(api/unroll (api/fold-by DS [:V1]) [:V4 :V2 :V3] {:indexes? "vector idx"})
```

_unnamed [9 5]:

| :V1 | vector idx | :V2 | :V3 | :V4 |
|-----|------------|-----|--------|--------------|
| 1 | 0 | 1 | 0.5000 | A |
| 1 | 1 | 3 | 1.500 | \mathbf{C} |
| 1 | 2 | 5 | 1.000 | В |
| 1 | 3 | 7 | 0.5000 | A |
| 1 | 4 | 9 | 1.500 | \mathbf{C} |
| 2 | 0 | 2 | 1.000 | В |
| 2 | 1 | 4 | 0.5000 | A |
| 2 | 2 | 6 | 1.500 | \mathbf{C} |
| 2 | 3 | 8 | 1.000 | В |

You can also force datatypes

_unnamed :column info [4 4]:

| :name | :datatype | :n-elems | :categorical? |
|-------|-----------|----------|---------------|
| :V1 | :int64 | 9 | |
| :V2 | :int16 | 9 | |
| :V3 | :float32 | 9 | |
| :V4 | :string | 9 | true |

This works also on grouped dataset

```
(-> DS
    (api/group-by :V1)
    (api/fold-by [:V1 :V4])
    (api/unroll :V3 {:indexes? true})
    (api/ungroup))
```

_unnamed [9 5]:

| :V4 | :V1 | :V2 | :indexes | :V3 |
|--------------|------|-----------|----------|--------|
| A | 1 | $[1 \ 7]$ | 0 | 0.5000 |
| A | 1 | $[1 \ 7]$ | 1 | 0.5000 |
| В | 1 | [5] | 0 | 1.000 |
| \mathbf{C} | 1 | $[3 \ 9]$ | 0 | 1.500 |
| \mathbf{C} | 1 | $[3 \ 9]$ | 1 | 1.500 |
| \mathbf{C} | 2 | [6] | 0 | 1.500 |
| A | 2 | [4] | 0 | 0.5000 |
| В | 2 | $[2\ 8]$ | 0 | 1.000 |
| В | 2 | $[2 \ 8]$ | 1 | 1.000 |

Reshape

Reshaping data provides two types of operations:

- pivot->longer converting columns to rows
- pivot->wider converting rows to columns

Both functions are inspired on tidyr R package and provide almost the same functionality.

All examples are taken from mentioned above documentation.

Both functions work only on regular dataset.

Longer

pivot->longer converts columns to rows. Column names are treated as data.

Arguments:

- dataset
- columns selector
- options:
 - :target-columns names of the columns created or columns pattern (see below) (default: :\$column)
 - :value-column-name name of the column for values (default: :\$value)
 - :splitter string, regular expression or function which splits source column names into data
 - :drop-missing? remove rows with missing? (default: :true)
 - :datatypes map of target columns data types

:target-columns - can be:

- column name source columns names are put there as a data
- column names as sequence source columns names after split are put separately into :target-columns as data
- pattern is a sequence of names, where some of the names are nil. nil is replaced by a name taken from splitter and such column is used for values.

Create rows from all columns but "religion".

(def relig-income (api/dataset "data/relig_income.csv"))

relig-income

When data contains multiple observations per row, we can use splitter and pattern for target columns to create new columns and put values there. In following dataset we have two observations dob and gender for two childs. We want to put child infomation into the column and leave dob and gender for values.

```
(def family (api/dataset "data/family.csv"))
```

family

data/family.csv [5 5]:

| family | ${\rm dob_child1}$ | dob_child2 | ${\rm gender_child1}$ | ${\rm gender_child2}$ |
|--------|---------------------|---------------|------------------------|------------------------|
| 1 | 1998-11-26 | 2000-01-29 | 1 | 2 |
| 2 | 1996-06-22 | | 2 | |
| 3 | 2002-07-11 | 2004-04-05 | 2 | 2 |
| 4 | 2004-10-10 | 2009-08-27 | 1 | 1 |
| 5 | 2000 - 12 - 05 | 2005-02-28 | 2 | 1 |

data/family.csv [9 4]:

| family | :child | dob | gender |
|--------|--------|----------------|--------|
| 1 | child1 | 1998-11-26 | 1 |
| 2 | child1 | 1996-06-22 | 2 |
| 3 | child1 | 2002-07-11 | 2 |
| 4 | child1 | 2004-10-10 | 1 |
| 5 | child1 | 2000 - 12 - 05 | 2 |
| 1 | child2 | 2000-01-29 | 2 |
| 3 | child2 | 2004-04-05 | 2 |
| 4 | child2 | 2009-08-27 | 1 |
| 5 | child2 | 2005-02-28 | 1 |

Similar here, we have two observations: x and y in four groups.

```
(def anscombe (api/dataset "data/anscombe.csv"))
```

anscombe

Wider

pivot->wider converts rows to columns.

Arguments:

- dataset
- columns-selector values from selected columns are converted to new columns
- value-columns what are values

When multiple columns are used as columns selector, names are joined using :concat-columns-with option. :concat-columns-with can be a string or function (default: "__"). Function accepts sequence of names.

When columns-selector creates non unique set of values, they are folded using :fold-fn (default: vec) option.

When value-columns is a sequence, multiple observations as columns are created appending value column names into new columns. Column names are joined using :concat-value-with option. :concat-value-with can be a string or function (default: "-"). Function accepts current column name and value.

Use station as a name source for columns and seen for values

```
(def fish (api/dataset "data/fish_encounters.csv"))
fish
```

Multi-choice

$\underline{\quad}$ unnamed [4 4]:

| :id | :choice1 | :choice2 | :choice3 |
|-----|--------------|----------|----------|
| 1 | A | В | C |
| 2 | \mathbf{C} | В | |
| 3 | D | | |
| 4 | В | D | |

Step 1 - convert all choices into rows and add artificial column to all values which are not missing.

multi2

_unnamed [8 4]:

| :id | :column :value | :checked | |
|-----|----------------|--------------|------|
| 1 | :choice1 | A | true |
| 2 | :choice1 | \mathbf{C} | true |
| 3 | :choice1 | D | true |
| 4 | :choice1 | В | true |
| 1 | :choice2 | В | true |
| 2 | :choice2 | В | true |
| 4 | :choice2 | D | true |
| 1 | :choice3 | \mathbf{C} | true |

Step 2 - Convert back to wide form with actual choices as columns

```
(-> multi2
    (api/drop-columns :$column)
    (api/pivot->wider :$value :checked {:drop-missing? false})
    (api/order-by :id))
```

$\underline{\quad}$ unnamed [4 5]:

| :id | A | В | С | D |
|-----|------|-----------------------|-----------------------|-----------------------|
| 1 | true | true | true | |
| 2 | | ${ m true}$ | true | |
| 3 | | | | true |
| 4 | | true | | true |

Construction

construction

data/construction.csv [9 9]:

| Year | Month | 1 unit | 2 to 4 units | 5 units or more | Northeast | Midwest | South | West |
|------|----------|--------|--------------|-----------------|-----------|---------|-------|------|
| 2018 | January | 859 | | 348 | 114 | 169 | 596 | 339 |
| 2018 | February | 882 | | 400 | 138 | 160 | 655 | 336 |
| 2018 | March | 862 | | 356 | 150 | 154 | 595 | 330 |
| 2018 | April | 797 | | 447 | 144 | 196 | 613 | 304 |

| Y | | -2.16794818 | | -1.0360686 | |

Join/Concat Datasets

Dataset join and concatenation functions.

Joins accept left-side and right-side datasets and columns selector. Options are the same as in tech.ml.dataset functions.

The difference between tech.ml.dataset join functions are: arguments order (first datasets) and possibility to join on multiple columns.

Additionally set operations are defined: intersect and difference.

To concat two datasets rowwise you can choose:

- concat concats rows for matching columns, the number of columns should be equal.
- union like concat but returns unique values
- bind concats rows add missing, empty columns

To add two datasets columnwise use bind. The number of rows should be equal.

Datasets used in examples:

 $\underline{\hspace{0.2cm}}$ unnamed [9 3]:

| :a | :b | :0 |
|----|-----|--------------|
| 1 | 101 | a |
| 2 | 102 | b |

data.table

Below you can find comparizon between functionality of data.table and Clojure dataset API. I leave it without comments, please refer original document explaining details:

Introduction to data.table

 \mathbf{R}

```
library(data.table)
library(knitr)

flights <- fread("https://raw.githubusercontent.com/Rdatatable/data.table/master/vignettes/flights14.cs
kable(head(flights))</pre>
```

| year | month | day | dep_delay | arr_delay | carrier | origin | dest | air_time | distance | hour |
|----------|-------|-----|-----------|-----------|---------|-------------|------|----------|----------|------|
| ${2014}$ | 1 | 1 | 14 | 13 | AA | JFK | LAX | 359 | 2475 | 9 |
| 2014 | 1 | 1 | -3 | 13 | AA | $_{ m JFK}$ | LAX | 363 | 2475 | 11 |
| 2014 | 1 | 1 | 2 | 9 | AA | $_{ m JFK}$ | LAX | 351 | 2475 | 19 |
| 2014 | 1 | 1 | -8 | -26 | AA | LGA | PBI | 157 | 1035 | 7 |
| 2014 | 1 | 1 | 2 | 1 | AA | $_{ m JFK}$ | LAX | 350 | 2475 | 13 |
| 2014 | 1 | 1 | 4 | 0 | AA | EWR | LAX | 339 | 2454 | 18 |

Clojure

https://raw.githubusercontent.com/Rdatatable/data.table/master/vignettes/flights14.csv [6 11]:

| year | month | day | dep_delay | arr_delay | carrier | origin | dest | air_time | distance | hour |
|------|-------|-----|-----------|-----------|---------|-------------|------|----------|----------|------|
| 2014 | 1 | 1 | 14 | 13 | AA | JFK | LAX | 359 | 2475 | 9 |
| 2014 | 1 | 1 | -3 | 13 | AA | $_{ m JFK}$ | LAX | 363 | 2475 | 11 |
| 2014 | 1 | 1 | 2 | 9 | AA | $_{ m JFK}$ | LAX | 351 | 2475 | 19 |
| 2014 | 1 | 1 | -8 | -26 | AA | LGA | PBI | 157 | 1035 | 7 |
| 2014 | 1 | 1 | 2 | 1 | AA | JFK | LAX | 350 | 2475 | 13 |
| 2014 | 1 | 1 | 4 | 0 | AA | EWR | LAX | 339 | 2454 | 18 |

Basics

Shape of loaded data

 \mathbf{R}

```
dim(flights)
```

```
[1] 253316 11
```

Clojure

```
(api/shape flights)
```

[253316 11]

What is data.table?

 \mathbf{R}

```
DT = data.table(
   ID = c("b","b","b","a","a","c"),
   a = 1:6,
   b = 7:12,
   c = 13:18
)
kable(DT)
```

| ID | a | b | $^{\mathrm{c}}$ |
|--------------|---|----|-----------------|
| b | 1 | 7 | 13 |
| b | 2 | 8 | 14 |
| b | 3 | 9 | 15 |
| a | 4 | 10 | 16 |
| a | 5 | 11 | 17 |
| \mathbf{c} | 6 | 12 | 18 |
| | | | |

class(DT\$ID)

[1] "character"

 ${\bf Clojure}$

 $\underline{}$ unnamed [6 4]:

| :ID | :a | :b | :c |
|--------------|----|----|----|
| b | 1 | 7 | 13 |
| b | 2 | 8 | 14 |
| b | 3 | 9 | 15 |
| a | 4 | 10 | 16 |
| a | 5 | 11 | 17 |
| \mathbf{c} | 6 | 12 | 18 |
| | | | |

```
(-> :ID DT meta :datatype)
```

:string

Get all the flights with "JFK" as the origin airport in the month of June.

 \mathbf{R}

```
ans <- flights[origin == "JFK" & month == 6L]
kable(head(ans))</pre>
```

| year | month | day | dep_delay | arr_delay | carrier | origin | dest | air_time | distance | hour |
|------|-------|-----|--------------|-----------|---------|-------------|------|----------|----------|------|
| 2014 | 6 | 1 | -9 | -5 | AA | JFK | LAX | 324 | 2475 | 8 |
| 2014 | 6 | 1 | -10 | -13 | AA | $_{ m JFK}$ | LAX | 329 | 2475 | 12 |
| 2014 | 6 | 1 | 18 | -1 | AA | $_{ m JFK}$ | LAX | 326 | 2475 | 7 |

Aggregations

How can we get the number of trips corresponding to each origin airport?

 \mathbf{R}

```
ans <- flights[, .(.N), by = .(origin)]
kable(ans)</pre>
```

| origin | N |
|--------|-------|
| JFK | 81483 |
| LGA | 84433 |
| EWR | 87400 |

Clojure

```
(-> flights
   (api/group-by ["origin"])
   (api/aggregate {:N api/row-count}))
```

 $\underline{}$ unnamed [3 2]:

| origin | :N |
|-------------|-------|
| LGA | 84433 |
| EWR | 87400 |
| $_{ m JFK}$ | 81483 |
| | |

How can we calculate the number of trips for each origin airport for carrier code "AA"?

 \mathbf{R}

```
ans <- flights[carrier == "AA", .N, by = origin]
kable(ans)</pre>
```

| origin | N |
|--------|-------|
| JFK | 11923 |
| LGA | 11730 |
| EWR | 2649 |

Clojure

```
(-> flights
   (api/select-rows #(= (get % "carrier") "AA"))
   (api/group-by ["origin"])
   (api/aggregate {:N api/row-count}))
```

 $\underline{\quad}$ unnamed [3 2]:

| origin | :N |

How can we concatenate columns a and b for each group in ID?

R

```
kable(DT[, .(val = c(a,b)), by = ID])
```

| ID | val |
|----|-----|
| b | 1 |
| b | 2 |
| b | 3 |
| b | 7 |
| b | 8 |
| b | 6 |
| a | 4 |

| ID | val |
|--------------|-----|
| a | 5 |
| a | 10 |
| a | 11 |
| \mathbf{c} | 6 |
| c | 12 |

Clojure

```
(-> DT
    (api/pivot->longer [:a :b] {:value-column-name :val})
    (api/drop-columns [:$column :c]))
```

_unnamed [12 2]:

| :ID | :va |
|--------------|-----|
| b | 1 |
| b | 2 |
| b | 3 |
| a | 4 |
| a | 5 |
| \mathbf{c} | 6 |
| b | 7 |
| b | 8 |
| b | 9 |
| a | 10 |
| a | 11 |
| \mathbf{c} | 12 |
| | |

What if we would like to have all the values of column a and b concatenated, but returned as a list column?

 ${\bf R}$

```
kable(DT[, .(val = list(c(a,b))), by = ID])
```

| ID | val |
|--------------|------------------|
| b | 1, 2, 3, 7, 8, 9 |
| a | 4, 5, 10, 11 |
| \mathbf{c} | 6, 12 |

Clojure

```
(-> DT
    (api/pivot->longer [:a :b] {:value-column-name :val})
    (api/drop-columns [:$column :c])
    (api/fold-by :ID))
```

 $\underline{\quad}$ unnamed [3 2]:

| :ID | :val |
|--------|------------------------------|
| a b | [4 5 10 11] [1 2 3 7 8 9] |
| c | [6 12] |

API tour

Below snippets are taken from A data.table and dplyr tour written by Atrebas (permission granted).

I keep structure and subtitles but I skip ${\tt data.table}$ and ${\tt dplyr}$ examples.

Example data

_unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 7 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |

Basic Operations

Filter rows

Filter rows using indices

```
(api/select-rows DS [2 3])
```

 $\underline{}$ unnamed [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 3 | 1.5 | С |
| 2 | 4 | 0.5 | A |

Discard rows using negative indices

In Clojure API we have separate function for that: drop-rows.

```
(api/drop-rows DS (range 2 7))
```

 $\underline{\quad}$ unnamed [4 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |

Filter rows using a logical expression

```
(api/select-rows DS (comp #(> % 5) :V2))
```

_unnamed [4 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 2 | 6 | 1.5 | $^{\rm C}$ |
| 1 | 7 | 0.5 | A |
| 2 | 8 | 1.0 | В |
| 1 | 9 | 1.5 | \mathbf{C} |

```
(api/select-rows DS (comp #{"A" "C"} :V4))
```

 $\underline{\text{unnamed } [6 \ 4]}$:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 2 | 6 | 1.5 | \mathbf{C} |
| 1 | 7 | 0.5 | A |
| 1 | 9 | 1.5 | \mathbf{C} |
| | | | |

Filter rows using multiple conditions

 $\underline{}$ unnamed [2 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|-----|
| 1 | 1 | 0.5 | A |
| 1 | 7 | 0.5 | A |

Filter unique rows

(api/unique-by DS)

 $\underline{}$ unnamed [9 4]:

| :V1 | :V2 | :V3 | :V4 |
|-----|-----|-----|--------------|
| 1 | 1 | 0.5 | A |
| 2 | 2 | 1.0 | В |
| 1 | 3 | 1.5 | \mathbf{C} |
| 2 | 4 | 0.5 | A |
| 1 | 5 | 1.0 | В |
| 2 | 6 | 1.5 | \mathbf{C} |
